

CONTENTS

Foreword	ix
Preface	xi
Nomenclature and Conventions	xiii
1 Introduction	1
1.1 What is multi-way analysis?	1
1.2 Conceptual aspects of multi-way data analysis	1
1.3 Hierarchy of multivariate data structures in chemistry	5
1.4 Principal component analysis and PARAFAC	11
1.5 Summary	12
2 Array definitions and properties	13
2.1 Introduction	13
2.2 Rows, columns and tubes; frontal, lateral and horizontal slices	13
2.3 Elementary operations	15
2.4 Linearity concepts	21
2.5 Rank of two-way arrays	22
2.6 Rank of three-way arrays	28
2.7 Algebra of multi-way analysis	32
2.8 Summary	34
Appendix 2.A	34
3 Two-way component and regression models	35
3.1 Models for two-way one-block data analysis: component models	35
3.2 Models for two-way two-block data analysis: regression models	46
3.3 Summary	53
Appendix 3.A: some PCA results	54
Appendix 3.B: PLS algorithms	55

4	Three-way component and regression models	57
4.1	Historical introduction to multi-way models	57
4.2	Models for three-way one-block data: three-way component models	59
4.3	Models for three-way two-block data: three-way regression models	76
4.4	Summary	83
	Appendix 4.A: alternative notation for the PARAFAC model	84
	Appendix 4.B: alternative notations for the Tucker3 model	86
5	Some properties of three-way component models	89
5.1	Relationships between three-way component models	89
5.2	Rotational freedom and uniqueness in three-way component models	98
5.3	Properties of Tucker3 models	106
5.4	Degeneracy problem in PARAFAC models	107
5.5	Summary	109
6	Algorithms	111
6.1	Introduction	111
6.2	Optimization techniques	111
6.3	PARAFAC algorithms	113
6.4	Tucker3 algorithms	119
6.5	Tucker2 and Tucker1 algorithms	123
6.6	Multi-linear partial least squares regression	124
6.7	Multi-way covariates regression models	128
6.8	Core rotation in Tucker3 models	130
6.9	Handling missing data	131
6.10	Imposing non-negativity	135
6.11	Summary	136
	Appendix 6.A: closed-form solution for the PARAFAC model	136
	Appendix 6.B: proof that the weights in trilinear PLS1 can be obtained from a singular value decomposition	144
7	Validation and diagnostics	145
7.1	What is validation?	145
7.2	Test-set and cross-validation	147
7.3	Selecting which model to use	154
7.4	Selecting the number of components	156
7.5	Residual and influence analysis	166
7.6	Summary	173
8	Visualization	175
8.1	Introduction	175
8.2	History of plotting in three-way analysis	179
8.3	History of plotting in chemical three-way analysis	180
8.4	Scree plots	180

8.5	Line plots	184
8.6	Scatter plots	190
8.7	Problems with scatter plots	192
8.8	Image analysis	201
8.9	Dendrograms	202
8.10	Visualizing the Tucker core array	204
8.11	Joint plots	205
8.12	Residual plots	216
8.13	Leverage plots	216
8.14	Visualization of large data sets	216
8.15	Summary	219
9	Preprocessing	221
9.1	Background	221
9.2	Two-way centering	228
9.3	Two-way scaling	232
9.4	Simultaneous two-way centering and scaling	238
9.5	Three-way preprocessing	239
9.6	Summary	244
	Appendix 9.A: other types of preprocessing	245
	Appendix 9.B: geometric view of centering	247
	Appendix 9.C: fitting bilinear model plus offsets across one mode equals fitting a bilinear model to centered data	249
	Appendix 9.D: rank reduction and centering	250
	Appendix 9.E: centering data with missing values	251
	Appendix 9.F: incorrect centering introduces artificial variation	251
	Appendix 9.G: alternatives to centering	254
10	Applications	257
10.1	Introduction	257
10.2	Curve resolution of fluorescence data	259
10.3	Second-order calibration	276
10.4	Multi-way regression	285
10.5	Process chemometrics	288
10.6	Exploratory analysis in chromatography	302
10.7	Exploratory analysis in environmental sciences	312
10.8	Exploratory analysis of designed data	323
10.9	Analysis of variance of data with complex interactions	340
	Appendix 10.A: an illustration of the generalized rank annihilation method	346
	Appendix 10.B: other types of second-order calibration problems	347
	Appendix 10.C: the multiple standards calibration model of the second-order calibration example	349
	References	351
	Index	377
