0	Goals of this Book and Global Overview	1
0.1	What is this book?	1
0.2	Why has this book been written?	2
0.3	For whom is this book intended?	2
0.4	Why should I read this book?	2
0.5	The structure of this book	3
0.6	What this book does not cover	4
0.7	Contact, feedback and more information	4
PART I THE CONTINUOUS THEORY OF PARTIAL DIFFERENTIAL EQUATIONS		5
1	An Introduction to Ordinary Differential Equations	7
1.1	Introduction and objectives	7
1.2	Two-point boundary value problem	8
1.2.1	Special kinds of boundary condition	8
1.3	Linear boundary value problems	9
1.4	Initial value problems	10
1.5	Some special cases	10
1.6	Summary and conclusions	11
2	An Introduction to Partial Differential Equations	13
2.1	Introduction and objectives	13
2.2	Partial differential equations	13
2.3	Specialisations	15
2.3.1	Elliptic equations	15
2.3.2	Free boundary value problems	17
2.4	Parabolic partial differential equations	18
2.4.1	Special cases	20
2.5	Hyperbolic equations	20
2.5.1	Second-order equations	20
2.5.2	First-order equations	21

2.6	Systems of equations	22
2.6.1	Parabolic systems	22
2.6.2	First-order hyperbolic systems	22
2.7	Equations containing integrals	23
2.8	Summary and conclusions	24
3	Second-Order Parabolic Differential Equations	25
3.1	Introduction and objectives	25
3.2	Linear parabolic equations	25
3.3	The continuous problem	26
3.4	The maximum principle for parabolic equations	28
3.5	A special case: one-factor generalised Black–Scholes models	29
3.6	Fundamental solution and the Green’s function	30
3.7	Integral representation of the solution of parabolic PDEs	31
3.8	Parabolic equations in one space dimension	33
3.9	Summary and conclusions	35
4	An Introduction to the Heat Equation in One Dimension	37
4.1	Introduction and objectives	37
4.2	Motivation and background	38
4.3	The heat equation and financial engineering	39
4.4	The separation of variables technique	40
4.4.1	Heat flow in a rod with ends held at constant temperature	42
4.4.2	Heat flow in a rod whose ends are at a specified variable temperature	42
4.4.3	Heat flow in an infinite rod	43
4.4.4	Eigenfunction expansions	43
4.5	Transformation techniques for the heat equation	44
4.5.1	Laplace transform	45
4.5.2	Fourier transform for the heat equation	45
4.6	Summary and conclusions	46
5	An Introduction to the Method of Characteristics	47
5.1	Introduction and objectives	47
5.2	First-order hyperbolic equations	47
5.2.1	An example	48
5.3	Second-order hyperbolic equations	50
5.3.1	Numerical integration along the characteristic lines	50
5.4	Applications to financial engineering	53
5.4.1	Generalisations	55
5.5	Systems of equations	55
5.5.1	An example	57
5.6	Propagation of discontinuities	57
5.6.1	Other problems	58
5.7	Summary and conclusions	59

PART II FINITE DIFFERENCE METHODS: THE FUNDAMENTALS	61
6 An Introduction to the Finite Difference Method	63
6.1 Introduction and objectives	63
6.2 Fundamentals of numerical differentiation	63
6.3 Caveat: accuracy and round-off errors	65
6.4 Where are divided differences used in instrument pricing?	67
6.5 Initial value problems	67
6.5.1 Padé matrix approximations	68
6.5.2 Extrapolation	71
6.6 Nonlinear initial value problems	72
6.6.1 Predictor–corrector methods	73
6.6.2 Runge–Kutta methods	74
6.7 Scalar initial value problems	75
6.7.1 Exponentially fitted schemes	76
6.8 Summary and conclusions	76
7 An Introduction to the Method of Lines	79
7.1 Introduction and objectives	79
7.2 Classifying semi-discretisation methods	79
7.3 Semi-discretisation in space using FDM	80
7.3.1 A test case	80
7.3.2 Toeplitz matrices	82
7.3.3 Semi-discretisation for convection-diffusion problems	82
7.3.4 Essentially positive matrices	84
7.4 Numerical approximation of first-order systems	85
7.4.1 Fully discrete schemes	86
7.4.2 Semi-linear problems	87
7.5 Summary and conclusions	89
8 General Theory of the Finite Difference Method	91
8.1 Introduction and objectives	91
8.2 Some fundamental concepts	91
8.2.1 Consistency	93
8.2.2 Stability	93
8.2.3 Convergence	94
8.3 Stability and the Fourier transform	94
8.4 The discrete Fourier transform	96
8.4.1 Some other examples	98
8.5 Stability for initial boundary value problems	99
8.5.1 Gerschgorin’s circle theorem	100
8.6 Summary and conclusions	101
9 Finite Difference Schemes for First-Order Partial Differential Equations	103
9.1 Introduction and objectives	103
9.2 Scoping the problem	103

9.3	Why first-order equations are different: Essential difficulties	105
9.3.1	Discontinuous initial conditions	106
9.4	A simple explicit scheme	106
9.5	Some common schemes for initial value problems	108
9.5.1	Some other schemes	110
9.6	Some common schemes for initial boundary value problems	110
9.7	Monotone and positive-type schemes	110
9.8	Extensions, generalisations and other applications	111
9.8.1	General linear problems	112
9.8.2	Systems of equations	112
9.8.3	Nonlinear problems	114
9.8.4	Several independent variables	114
9.9	Summary and conclusions	115
10	FDM for the One-Dimensional Convection–Diffusion Equation	117
10.1	Introduction and objectives	117
10.2	Approximation of derivatives on the boundaries	118
10.3	Time-dependent convection–diffusion equations	120
10.4	Fully discrete schemes	120
10.5	Specifying initial and boundary conditions	121
10.6	Semi-discretisation in space	121
10.7	Semi-discretisation in time	122
10.8	Summary and conclusions	122
11	Exponentially Fitted Finite Difference Schemes	123
11.1	Introduction and objectives	123
11.2	Motivating exponential fitting	123
11.2.1	‘Continuous’ exponential approximation	124
11.2.2	‘Discrete’ exponential approximation	125
11.2.3	Where is exponential fitting being used?	128
11.3	Exponential fitting and time-dependent convection-diffusion	128
11.4	Stability and convergence analysis	129
11.5	Approximating the derivative of the solution	131
11.6	Special limiting cases	132
11.7	Summary and conclusions	132
PART III	APPLYING FDM TO ONE-FACTOR INSTRUMENT PRICING	135
12	Exact Solutions and Explicit Finite Difference Method for One-Factor Models	137
12.1	Introduction and objectives	137
12.2	Exact solutions and benchmark cases	137
12.3	Perturbation analysis and risk engines	139
12.4	The trinomial method: Preview	139
12.4.1	Stability of the trinomial method	141
12.5	Using exponential fitting with explicit time marching	142
12.6	Approximating the Greeks	142

	Contents	ix
12.7	Summary and conclusions	144
12.8	Appendix: the formula for Vega	144
13	An Introduction to the Trinomial Method	147
13.1	Introduction and objectives	147
13.2	Motivating the trinomial method	147
13.3	Trinomial method: Comparisons with other methods	149
13.3.1	A general formulation	150
13.4	The trinomial method for barrier options	151
13.5	Summary and conclusions	152
14	Exponentially Fitted Difference Schemes for Barrier Options	153
14.1	Introduction and objectives	153
14.2	What are barrier options?	153
14.3	Initial boundary value problems for barrier options	154
14.4	Using exponential fitting for barrier options	154
14.4.1	Double barrier call options	156
14.4.2	Single barrier call options	156
14.5	Time-dependent volatility	156
14.6	Some other kinds of exotic options	157
14.6.1	Plain vanilla power call options	158
14.6.2	Capped power call options	158
14.7	Comparisons with exact solutions	159
14.8	Other schemes and approximations	162
14.9	Extensions to the model	162
14.10	Summary and conclusions	163
15	Advanced Issues in Barrier and Lookback Option Modelling	165
15.1	Introduction and objectives	165
15.2	Kinds of boundaries and boundary conditions	165
15.3	Discrete and continuous monitoring	168
15.3.1	What is discrete monitoring?	168
15.3.2	Finite difference schemes and jumps in time	169
15.3.3	Lookback options and jumps	170
15.4	Continuity corrections for discrete barrier options	171
15.5	Complex barrier options	171
15.6	Summary and conclusions	173
16	The Meshless (Meshfree) Method in Financial Engineering	175
16.1	Introduction and objectives	175
16.2	Motivating the meshless method	175
16.3	An introduction to radial basis functions	177
16.4	Semi-discretisations and convection–diffusion equations	177
16.5	Applications of the one-factor Black–Scholes equation	179
16.6	Advantages and disadvantages of meshless	180
16.7	Summary and conclusions	181

17	Extending the Black–Scholes Model: Jump Processes	183
17.1	Introduction and objectives	183
17.2	Jump–diffusion processes	183
17.2.1	Convolution transformations	185
17.3	Partial integro-differential equations and financial applications	186
17.4	Numerical solution of PIDE: Preliminaries	187
17.5	Techniques for the numerical solution of PIDEs	188
17.6	Implicit and explicit methods	188
17.7	Implicit–explicit Runge–Kutta methods	189
17.8	Using operator splitting	189
17.9	Splitting and predictor–corrector methods	190
17.10	Summary and conclusions	191
PART IV	FDM FOR MULTIDIMENSIONAL PROBLEMS	193
18	Finite Difference Schemes for Multidimensional Problems	195
18.1	Introduction and objectives	195
18.2	Elliptic equations	195
18.2.1	A self-adjoint elliptic operator	198
18.2.2	Solving the matrix systems	199
18.2.3	Exact solutions to elliptic problems	200
18.3	Diffusion and heat equations	202
18.3.1	Exact solutions to the heat equation	204
18.4	Advection equation in two dimensions	205
18.4.1	Initial boundary value problems	207
18.5	Convection–diffusion equation	207
18.6	Summary and conclusions	208
19	An Introduction to Alternating Direction Implicit and Splitting Methods	209
19.1	Introduction and objectives	209
19.2	What is ADI, really?	210
19.3	Improvements on the basic ADI scheme	212
19.3.1	The D’Yakonov scheme	212
19.3.2	Approximate factorization of operators	213
19.3.3	ADI classico for two-factor models	215
19.4	ADI for first-order hyperbolic equations	215
19.5	ADI classico and three-dimensional problems	217
19.6	The Hopscotch method	218
19.7	Boundary conditions	219
19.8	Summary and conclusions	221
20	Advanced Operator Splitting Methods: Fractional Steps	223
20.1	Introduction and objectives	223
20.2	Initial examples	223
20.3	Problems with mixed derivatives	224
20.4	Predictor–corrector methods (approximation correctors)	226
20.5	Partial integro-differential equations	227

	Contents	xi
20.6	More general results	228
20.7	Summary and conclusions	228
21	Modern Splitting Methods	229
21.1	Introduction and objectives	229
21.2	Systems of equations	229
21.2.1	ADI and splitting for parabolic systems	230
21.2.2	Compound and chooser options	231
21.2.3	Leveraged knock-in options	232
21.3	A different kind of splitting: The IMEX schemes	232
21.4	Applicability of IMEX schemes to Asian option pricing	234
21.5	Summary and conclusions	235
PART V	APPLYING FDM TO MULTI-FACTOR INSTRUMENT PRICING	237
22	Options with Stochastic Volatility: The Heston Model	239
22.1	Introduction and objectives	239
22.2	An introduction to Ornstein–Uhlenbeck processes	239
22.3	Stochastic differential equations and the Heston model	240
22.4	Boundary conditions	241
22.4.1	Standard european call option	242
22.4.2	European put options	242
22.4.3	Other kinds of boundary conditions	242
22.5	Using finite difference schemes: Prologue	243
22.6	A detailed example	243
22.7	Summary and conclusions	246
23	Finite Difference Methods for Asian Options and Other ‘Mixed’ Problems	249
23.1	Introduction and objectives	249
23.2	An introduction to Asian options	249
23.3	My first PDE formulation	250
23.4	Using operator splitting methods	251
23.4.1	For sake of completeness: ADI methods for asian option PDEs	253
23.5	Cheyette interest models	253
23.6	New developments	254
23.7	Summary and conclusions	255
24	Multi-Asset Options	257
24.1	Introduction and objectives	257
24.2	A taxonomy of multi-asset options	257
24.2.1	Exchange options	260
24.2.2	Rainbow options	261
24.2.3	Basket options	262
24.2.4	The best and worst	263
24.2.5	Quotient options	263
24.2.6	Foreign equity options	264
24.2.7	Quanto options	264

xii	Contents	
	24.2.8 Spread options	264
	24.2.9 Dual-strike options	265
	24.2.10 Out-performance options	265
24.3	Common framework for multi-asset options	265
24.4	An overview of finite difference schemes for multi-asset problems	266
24.5	Numerical solution of elliptic equations	267
24.6	Solving multi-asset Black–Scholes equations	269
24.7	Special guidelines and caveats	270
24.8	Summary and conclusions	271
25	Finite Difference Methods for Fixed-Income Problems	273
25.1	Introduction and objectives	273
25.2	An introduction to interest rate modelling	273
25.3	Single-factor models	274
25.4	Some specific stochastic models	276
25.4.1	The Merton model	277
25.4.2	The Vasicek model	277
25.4.3	Cox, Ingersoll and Ross (CIR)	277
25.4.4	The Hull–White model	277
25.4.5	Lognormal models	278
25.5	An introduction to multidimensional models	278
25.6	The thorny issue of boundary conditions	280
25.6.1	One-factor models	280
25.6.2	Multi-factor models	281
25.7	Introduction to approximate methods for interest rate models	282
25.7.1	One-factor models	282
25.7.2	Many-factor models	283
25.8	Summary and conclusions	283
PART VI	FREE AND MOVING BOUNDARY VALUE PROBLEMS	285
26	Background to Free and Moving Boundary Value Problems	287
26.1	Introduction and objectives	287
26.2	Notation and definitions	287
26.3	Some preliminary examples	288
26.3.1	Single-phase melting ice	288
26.3.2	One-factor option modelling: American exercise style	289
26.3.3	Two-phase melting ice	290
26.3.4	The inverse Stefan problem	290
26.3.5	Two and three space dimensions	291
26.3.6	Oxygen diffusion	293
26.4	Solutions in financial engineering: A preview	293
26.4.1	What kinds of early exercise features?	293
26.4.2	What kinds of numerical techniques?	294
26.5	Summary and conclusions	294

27 Numerical Methods for Free Boundary Value Problems:	
Front-Fixing Methods	295
27.1 Introduction and objectives	295
27.2 An introduction to front-fixing methods	295
27.3 A crash course on partial derivatives	295
27.4 Functions and implicit forms	297
27.5 Front fixing for the heat equation	299
27.6 Front fixing for general problems	300
27.7 Multidimensional problems	300
27.8 Front fixing and American options	303
27.9 Other finite difference schemes	305
27.9.1 The method of lines and predictor–corrector	305
27.10 Summary and conclusions	306
28 Viscosity Solutions and Penalty Methods for American Option Problems	307
28.1 Introduction and objectives	307
28.2 Definitions and main results for parabolic problems	307
28.2.1 Semi-continuity	307
28.2.2 Viscosity solutions of nonlinear parabolic problems	308
28.3 An introduction to semi-linear equations and penalty method	310
28.4 Implicit, explicit and semi-implicit schemes	311
28.5 Multi-asset American options	312
28.6 Summary and conclusions	314
29 Variational Formulation of American Option Problems	315
29.1 Introduction and objectives	315
29.2 A short history of variational inequalities	316
29.3 A first parabolic variational inequality	316
29.4 Functional analysis background	318
29.5 Kinds of variational inequalities	319
29.5.1 Diffusion with semi-permeable membrane	319
29.5.2 A one-dimensional finite element approximation	320
29.6 Variational inequalities using Rothe’s methods	323
29.7 American options and variational inequalities	324
29.8 Summary and conclusions	324
PART VII DESIGN AND IMPLEMENTATION IN C++	325
30 Finding the Appropriate Finite Difference Schemes for your Financial Engineering Problem	327
30.1 Introduction and objectives	327
30.2 The financial model	328
30.3 The viewpoints in the continuous model	328
30.3.1 Payoff functions	329
30.3.2 Boundary conditions	330
30.3.3 Transformations	331

30.4	The viewpoints in the discrete model	332
30.4.1	Functional and non-functional requirements	332
30.4.2	Approximating the spatial derivatives in the PDE	333
30.4.3	Time discretisation in the PDE	334
30.4.4	Payoff functions	334
30.4.5	Boundary conditions	335
30.5	Auxiliary numerical methods	335
30.6	New Developments	336
30.7	Summary and conclusions	336
31	Design and Implementation of First-Order Problems	337
31.1	Introduction and objectives	337
31.2	Software requirements	337
31.3	Modular decomposition	338
31.4	Useful C++ data structures	339
31.5	One-factor models	339
31.5.1	Main program and output	342
31.6	Multi-factor models	343
31.7	Generalisations and applications to quantitative finance	346
31.8	Summary and conclusions	347
31.9	Appendix: Useful data structures in C++	348
32	Moving to Black–Scholes	353
32.1	Introduction and objectives	353
32.2	The PDE model	354
32.3	The FDM model	355
32.4	Algorithms and data structures	355
32.5	The C++ model	356
32.6	Test case: The two-dimensional heat equation	357
32.7	Finite difference solution	357
32.8	Moving to software and method implementation	358
32.8.1	Defining the continuous problem	358
32.8.2	Creating a mesh	358
32.8.3	Choosing a scheme	360
32.8.4	Termination criterion	361
32.9	Generalisations	361
32.9.1	More general PDEs	361
32.9.2	Other finite difference schemes	361
32.9.3	Flexible software solutions	361
32.10	Summary and conclusions	362
33	C++ Class Hierarchies for One-Factor and Two-Factor Payoffs	363
33.1	Introduction and objectives	363
33.2	Abstract and concrete payoff classes	364
33.3	Using payoff classes	367
33.4	Lightweight payoff classes	368
33.5	Super-lightweight payoff functions	369

	Contents	xv
33.6	Payoff functions for multi-asset option problems	371
33.7	Caveat: non-smooth payoff and convergence degradation	373
33.8	Summary and conclusions	374
Appendices		375
A1	An introduction to integral and partial integro-differential equations	375
A2	An introduction to the finite element method	393
Bibliography		409
Index		417
