EDITORS' NOTES	1
<i>Anthony J. Petrosino, Taylor Martin, Vanessa Svihla</i>	

PART ONE: COMMUNITIES OF PRACTICE

1. The Emergence of a Community of Practice in Engineering Education	7
--	---

Yifat Ben-David Kolikant, Ann McKenna, Bugrahan Yalvac

This chapter explores how engineering faculty and learning scientists developed a collective wisdom in order to work together to develop course materials.

2. Desegregated Learning: An Innovative Framework for Programs of Study	17
---	----

Arturo A. Fuentes, Robert Freeman, Stephen Crown, Javier Kypuros, Hashim Mahdi

Too often courses exist in a vacuum, with the learning segregated into small units. This chapter discusses the effort of one group to “desegregate” their curriculum into a flow of integrated learning experiences.

PART TWO: TAKING CONTENT SERIOUSLY IN LEARNING SCIENCE RESEARCH

3. The Development of Adaptive Expertise in Biotransport	35
--	----

Taylor Martin, Anthony J. Petrosino, Stephanie Rivale, Kenneth R. Diller

The authors describe how they studied a biotransport course as a mechanism for continuous development of adaptive expertise, the ability of students to use their knowledge creatively and flexibly.

4. Establishing Experiences to Develop a Wisdom of Professional Practice	49
--	----

Joan M. T. Walker, Sean P. Brophy, Lynn Liao Hodge, John D. Bransford

The authors compare the performance of first-year and senior students' perceptions of two types of instructional material focused on professionalism, with an eye toward understanding how materials may be tailored to meet the needs of first-year and advanced undergraduates.

5. Teaching Writing in a Laboratory-Based Engineering Course with a “How People Learn” Framework	59
--	----

Bugrahan Yalvac, H. David Smith, Penny L. Hirsch, Gülnur Birol

This chapter discusses the effectiveness of a “How People Learn” framework used in a laboratory-based module designed to improve students’ written communication skills without compromising acquisition of content knowledge.

PART THREE: APPLYING THE MODEL TO OTHER POPULATIONS

6. Learning Content Using Complex Data in Project-Based Science: An Example from High School Biology in Urban Classrooms	77
--	----

David E. Kanter, Melissa Schreck

The authors explore the extent to which project-based science can help students make sense of complex scientific data and promote deep understanding.

7. The Effect of a Bioengineering Unit Across High School Contexts: An Initial Investigation in Urban, Suburban, and Rural Domains	93
--	----

Stacy S. Klein, Melissa J. Geist

The authors discuss the degree to which innovative curricula such as those developed in the VaNTH project are effective with students in different situations.

PART FOUR: EDUCATIONAL RESEARCH IN UNIVERSITY SETTINGS

8. Implementing Learning-Science Research in University Settings: New Research Opportunities	109
--	-----

Ann McKenna
