<b>About the Author</b>	<b>xi</b>
<b>Preface</b>	<b>xiii</b>
<b>Acknowledgements</b>	<b>xvii</b>
<b>1 Composites</b>	<b>1</b>
1.1 Classification and types of composites	1
1.2 Deformation, damage and fracture of composites: micromechanisms and roles of phases	5
1.2.1 Particle and short fiber reinforced composites	5
1.2.2 Long fiber reinforced composites	8
1.2.3 Laminates	10
References	11
<b>2 Mesoscale level in the mechanics of materials</b>	<b>13</b>
2.1 On the definitions of scale levels: micro- and mesomechanics	13
2.2 Size effects	14
2.2.1 Brittle and quasi-brittle materials	14
2.2.2 Metals	15
2.2.3 Thin films	16
2.3 Biocomposites	17
2.3.1 Nacre	17
2.3.2 Sponge spicules	18
2.3.3 Bamboo	19
2.3.4 Teeth	20
2.3.5 Bones	21
2.4 On some concepts of the improvement of material properties	22
2.4.1 Gradient composite materials	23
2.4.2 The application of coatings	23
2.4.3 Layered metal matrix composites	23
2.4.4 Surface composites	24
2.4.5 Agglomerates of small scale inclusions and the ‘double dispersion’ microstructures of steels	24
2.4.6 Inclusion networks	25

2.4.7	Interpenetrating phase composites (IPCs)	25
2.4.8	Hyperorganized structure control	26
2.4.9	Summary	27
2.5	Physical mesomechanics of materials	27
2.6	Topological and statistical description of microstructures of composites	29
	References	32
<b>3</b>	<b>Damage and failure of materials: concepts and methods of modeling</b>	<b>37</b>
3.1	Fracture mechanics: basic concepts	37
3.1.1	Griffith theory of brittle fracture	38
3.1.2	Stress field in the vicinity of a crack	39
3.1.3	Stress intensity factor and energy release rate	39
3.1.4	$J$ -integral and other models of plastic effects	40
3.2	Statistical theories of strength	42
3.2.1	Worst flaw and weakest link theories	42
3.2.2	Random processes and stochastic equations	44
3.2.3	Fiber bundle models and chains of fiber bundles	46
3.3	Damage mechanics	48
3.3.1	Models of elastic solids with many cracks	48
3.3.2	Phenomenological analysis of damage evolution (continuum damage mechanics)	49
3.3.3	Micromechanical models of void growth in ductile materials	50
3.3.4	Thermodynamic damage models	51
3.3.5	Nonlocal and gradient enhanced damage models	53
3.4	Numerical modeling of damage and fracture	55
	References	60
<b>4</b>	<b>Microstructure–strength relationships of composites: concepts and methods of analysis</b>	<b>65</b>
4.1	Interaction between elements of microstructures: physical and mechanical models	65
4.1.1	Theories of constrained plastic flow of ductile materials reinforced by hard inclusions	66
4.1.2	Shear lag model and its applications	69
4.2	Multiscale modeling of materials and homogenization	71
4.2.1	Multiscale modeling	72
4.2.2	Homogenization	74
4.3	Analytical estimations and bounds of overall elastic properties of composites	75
4.3.1	Rule-of-mixture and classical Voigt and Reuss approximations	76
4.3.2	Hashin–Shtrikman bounds	78
4.3.3	Dilute distribution model	80
4.3.4	Effective field method and Mori–Tanaka model	80
4.3.5	Composite sphere and composite cylinder assemblage	81
4.3.6	Self-consistent models and other effective medium methods	82
4.3.7	Method of cells and transformation field analysis	84
4.3.8	Incorporation of detailed microstructural information: three-point approximation	86

4.3.9	Generalized continua: nonlocal and gradient-enhanced models	87
4.3.10	Nonlinear material behavior	88
4.4	Computational models of microstructures and strength of composites	89
4.4.1	Unit cell models of composites	90
4.4.2	How to incorporate real microstructures of materials into numerical models	98
	References	105
<b>5</b>	<b>Computational experiments in the mechanics of materials: concepts and tools</b>	<b>115</b>
5.1	Concept of computational experiments in the mechanics of materials	115
5.2	Input data for the simulations: determination of material properties	116
5.2.1	Nanoindentation	117
5.2.2	In-situ experiments using a scanning electron microscope	117
5.2.3	Inverse analysis	118
5.3	Program codes for the automatic generation of 3D microstructural models of materials	120
5.3.1	Program Meso3D for the automatic geometry-based generation of 3D microstructural FE models of materials	120
5.3.2	Program Voxel2FEM for the automatic voxel-based generation of 3D microstructural FE models of materials	123
	References	127
<b>6</b>	<b>Numerical mesomechanical experiments: analysis of the effect of microstructures of materials on the deformation and damage resistance</b>	<b>129</b>
6.1	Finite element models of composite microstructures	130
6.2	Material properties used in the simulations	130
6.3	Damage modeling in composites with the User Defined Fields	131
6.3.1	Damage mechanisms and failure conditions	131
6.3.2	Subroutine User Defined Field	132
6.3.3	Interface debonding	133
6.4	Stability and reproducibility of the simulations	134
6.5	Effect of the amount and volume content of particles on the deformation and damage in the composite	137
6.6	Effect of particle clustering and the gradient distribution of particles	141
6.7	Effect of the variations of particle sizes on the damage evolution	145
6.8	Ranking of microstructures and the effect of gradient orientation	147
	References	149
<b>7</b>	<b>Graded particle reinforced composites: effect of the parameters of graded microstructures on the deformation and damage</b>	<b>151</b>
7.1	Damage evolution in graded composites and the effect of the degree of gradient	153
7.2	'Bilayer' model of a graded composite	159
7.3	Effect of the shape and orientation of elongated particles on the strength and damage evolution: nongraded composites	161
7.4	Effect of the shape and orientation of elongated particles on the strength and damage evolution: graded composites	165

7.5	Effect of statistical variations of local strengths of reinforcing particles and the distribution of the particle sizes	168
7.6	Combined Reuss–Voigt model and its application to the estimation of stiffness of graded materials	172
7.6.1	Estimation of the stiffness of materials with arbitrarily complex microstructures: combined Reuss–Voigt model	172
7.6.2	Effect of the degree of gradient on the elastic properties of the composite	172
7.6.3	Inclined interface: effect of the orientation of interfaces on the elastic properties	176
	References	177
<b>8</b>	<b>Particle clustering in composites: effect of clustering on the mechanical behavior and damage evolution</b>	<b>179</b>
8.1	Finite element modeling of the effect of clustering of particles on the damage evolution	179
8.1.1	Numerical models of clustered microstructures and statistical characterization of the microstructures	181
8.1.2	Simulation of damage and particle failure in clustered microstructures	183
8.2	Analytical modeling of the effect of particle clustering on the damage resistance	187
8.2.1	Cell array model of a composite	187
8.2.2	Probabilistic analysis of damage accumulation in a cell	191
8.2.3	Effect of particle clustering on the fracture toughness	193
