Preface	xiii
Acknowledgments	xv
Introduction	xvii
Appendix: dimensions, units and equations	xx
PART I THE SIGNAL OBSERVED	
1 Defining the signal	3
1.1 The power of light – luminosity and spectral power	3
1.2 Light through a surface – flux and flux density	7
1.3 The brightness of light – intensity and specific intensity	9
1.4 Light from all angles – energy density and mean intensity	13
1.5 How light pushes – radiation pressure	16
1.6 The human perception of light – magnitudes	19
1.6.1 Apparent magnitude	19
1.6.2 Absolute magnitude	22
1.6.3 The colour index, bolometric correction, and HR diagram	23
1.6.4 Magnitudes beyond stars	24
1.7 Light aligned – polarization	25
Problems	25
2 Measuring the signal	29
2.1 Spectral filters and the panchromatic universe	29
2.2 Catching the signal – the telescope	32
2.2.1 Collecting and focussing the signal	34
2.2.2 Detecting the signal	36
2.2.3 Field of view and pixel resolution	37
2.2.4 Diffraction and diffraction-limited resolution	38

2.3	The Corrupted signal – the atmosphere	41
2.3.1	Atmospheric refraction	42
2.3.2	Seeing	43
2.3.3	Adaptive optics	45
2.3.4	Scintillation	48
2.3.5	Atmospheric reddening	48
2.4	Processing the signal	49
2.4.1	Correcting the signal	49
2.4.2	Calibrating the signal	50
2.5	Analysing the signal	50
2.6	Visualizing the signal	52
	Problems	55
	Appendix: refraction in the Earth’s atmosphere	58

PART II MATTER AND RADIATION ESSENTIALS

3	Matter essentials	65
3.1	The Big Bang	65
3.2	Dark and light matter	66
3.3	Abundances of the elements	70
3.3.1	Primordial abundance	70
3.3.2	Stellar evolution and ISM enrichment	70
3.3.3	Supernovae and explosive nucleosynthesis	75
3.3.4	Abundances in the Milky Way, its star formation history and the IMF	77
3.4	The gaseous universe	82
3.4.1	Kinetic temperature and the Maxwell–Boltzmann velocity distribution	84
3.4.2	The ideal gas	88
3.4.3	The mean free path and collision rate	89
3.4.4	Statistical equilibrium, thermodynamic equilibrium, and LTE	93
3.4.5	Excitation and the Boltzmann Equation	96
3.4.6	Ionization and the Saha Equation	100
3.4.7	Probing the gas	101
3.5	The dusty Universe	104
3.5.1	Observational effects of dust	105
3.5.2	Structure and composition of dust	109
3.5.3	The origin of dust	111
3.6	Cosmic rays	112
3.6.1	Cosmic ray composition	112
3.6.2	The cosmic ray energy spectrum	113
3.6.3	The origin of cosmic rays	117
	Problems	118
	Appendix: the electron/proton ratio in cosmic rays	121
4	Radiation essentials	
4.1	Black body radiation	123
4.1.1	The brightness temperature	127
4.1.2	The Rayleigh–Jeans Law and Wien’s Law	129
4.1.3	Wien’s Displacement Law and stellar colour	130

4.1.4	The Stefan–Boltzmann Law, stellar luminosity and the HR diagram	132
4.1.5	Energy density and pressure in stars	134
4.2	Grey bodies and planetary temperatures	134
4.2.1	The equilibrium temperature of a grey body	136
4.2.2	Direct detection of extrasolar planets	140
	Problems	143
	Appendix: derivation of the Planck function	146
4.A.1	The statistical weight	146
4.A.2	The mean energy per state	147
4.A.3	The specific energy density and specific intensity	148

PART III THE SIGNAL PERTURBED

5 The interaction of light with matter 153

5.1	The photon redirected – scattering	154
5.1.1	Elastic scattering	157
5.1.2	Inelastic scattering	165
5.2	The photon lost – absorption	168
5.2.1	Particle kinetic energy – heating	168
5.2.2	Change of state – ionization and the Strömgren sphere	169
5.3	The wavefront redirected – refraction	172
5.4	Quantifying opacity and transparency	175
5.4.1	Total opacity and the optical depth	175
5.4.2	Dynamics of opacity – pulsation and stellar winds	178
5.5	The opacity of dust – extinction	182
	Problems	183

6 The signal transferred 187

6.1	Types of energy transfer	187
6.2	The equation of transfer	189
6.3	Solutions to the equation of transfer	191
6.3.1	Case A: no cloud	191
6.3.2	Case B: absorbing, but not emitting cloud	192
6.3.3	Case C: emitting, but not absorbing cloud	192
6.3.4	Case D: cloud in thermodynamic equilibrium (TE)	193
6.3.5	Case E: emitting and absorbing cloud	193
6.3.6	Case F: emitting and absorbing cloud in LTE	194
6.4	Implications of the LTE solution	195
6.4.1	Implications for temperature	195
6.4.2	Observability of emission and absorption lines	196
6.4.3	Determining temperature and optical depth of HI clouds	200
	Problems	204

7 The interaction of light with space 207

7.1	Space and time	207
7.2	Redshifts and blueshifts	210
7.2.1	The Doppler shift – deciphering dynamics	210
7.2.2	The expansion redshift	217
7.2.3	The gravitational redshift	219

7.3	Gravitational refraction	220
7.3.1	Geometry and mass of a gravitational lens	220
7.3.2	Microlensing – MACHOs and planets	225
7.3.3	Cosmological distances with gravitational lenses	226
7.4	Time variability and source size	227
	Problems	228
PART IV THE SIGNAL EMITTED		
8	Continuum emission	235
8.1	Characteristics of continuum emission – thermal and non-thermal	236
8.2	Bremsstrahlung (free–free) emission	237
8.2.1	The thermal Bremsstrahlung spectrum	237
8.2.2	Radio emission from HII and other ionized regions	242
8.2.3	X-ray emission from hot diffuse gas	245
8.3	Free–bound (recombination) emission	251
8.4	Two-photon emission	253
8.5	Synchrotron (and cyclotron) radiation	255
8.5.1	Cyclotron radiation – planets to pulsars	258
8.5.2	The synchrotron spectrum	262
8.5.3	Determining synchrotron source properties	268
8.5.4	Synchrotron sources – spurs, bubbles, jets, lobes and relics	270
8.6	Inverse Compton radiation	273
	Problems	276
9	Line emission	279
9.1	The richness of the spectrum – radio waves to gamma rays	280
9.1.1	Electronic transitions – optical and UV lines	280
9.1.2	Rotational and vibrational transitions – molecules, IR and mm-wave spectra	281
9.1.3	Nuclear transitions – γ -rays and high energy events	286
9.2	The line strengths, thermalization, and the critical gas density	288
9.3	Line broadening	290
9.3.1	Doppler broadening and temperature diagnostics	291
9.3.2	Pressure broadening	295
9.4	Probing physical conditions via electronic transitions	296
9.4.1	Radio recombination lines	297
9.4.2	Optical recombination lines	302
9.4.3	The 21 cm line of hydrogen	307
9.5	Probing physical conditions via molecular transitions	311
9.5.1	The CO molecule	311
	Problems	313
PART V THE SIGNAL DECODED		
10	Forensic astronomy	319
10.1	Complex spectra	319

10.1.1	Isolating the signal	319
10.1.2	Modelling the signal	321
10.2	Case studies – the active, the young, and the old	325
10.2.1	Case study 1: the Galactic Centre	326
10.2.2	Case study 2: the Cygnus star forming complex	329
10.2.3	Case study 3: the globular cluster, NGC 6397	331
10.3	The messenger and the message	335
	Problems	336
Appendix A: Mathematical and geometrical relations		339
A.1	Taylor series	339
A.2	Binomial expansion	339
A.3	Exponential expansion	340
A.4	Convolution	340
A.5	Properties of the ellipse	340
Appendix B: Astronomical geometry		343
B.1	One-dimensional and two-dimensional angles	343
B.2	Solid angle and the spherical coordinate system	344
Appendix C: The hydrogen atom		347
C.1	The hydrogen spectrum and principal quantum number	347
C.2	Quantum numbers, degeneracy, and statistical weight	352
C.3	Fine structure and the Zeeman effect	353
C.4	The $\lambda 21$ cm line of neutral hydrogen	354
Appendix D: Scattering processes		357
D.1	Elastic, or coherent scattering	358
D.1.1	Scattering from free electrons – Thomson scattering	358
D.1.2	Scattering from bound electrons I: the oscillator model	359
D.1.3	Scattering from bound electrons II: quantum mechanics	362
D.1.4	Scattering from bound electrons III: resonance scattering and the natural line shape	363
D.1.5	Scattering from bound electrons IV: Rayleigh scattering	366
D.2	Inelastic scattering – Compton scattering from free electrons	367
D.3	Scattering by dust	369
Appendix E: Plasmas, the plasma frequency, and plasma waves		373
Appendix F: The Hubble relation and the expanding Universe		377
F.1	Kinematics of the Universe	377
F.2	Dynamics of the Universe	383
F.3	Kinematics, dynamics and high redshifts	386
Appendix G: Tables and figures		389
References		401
Index		407
