Preface to Second Edition	xiii
Mixed Model Notations	xvii
1 Introduction	1
1.1 The Use of Mixed Models	1
1.2 Introductory Example	3
1.2.1 Simple model to assess the effects of treatment (Model A)	3
1.2.2 A model taking patient effects into account (Model B)	6
1.2.3 Random effects model (Model C)	6
1.2.4 Estimation (or prediction) of random effects	11
1.3 A Multi-Centre Hypertension Trial	12
1.3.1 Modelling the data	13
1.3.2 Including a baseline covariate (Model B)	13
1.3.3 Modelling centre effects (Model C)	16
1.3.4 Including centre-by-treatment interaction effects (Model D)	16
1.3.5 Modelling centre and centre-treatment effects as random (Model E)	17
1.4 Repeated Measures Data	18
1.4.1 Covariance pattern models	19
1.4.2 Random coefficients models	20
1.5 More about Mixed Models	22
1.5.1 What is a mixed model?	22
1.5.2 Why use mixed models?	23
1.5.3 Communicating results	24
1.5.4 Mixed models in medicine	25
1.5.5 Mixed models in perspective	25
1.6 Some Useful Definitions	27
1.6.1 Containment	27

1.6.2	Balance	28
1.6.3	Error strata	30
2	Normal Mixed Models	33
2.1	Model Definition	33
2.1.1	The fixed effects model	34
2.1.2	The mixed model	36
2.1.3	The random effects model covariance structure	38
2.1.4	The random coefficients model covariance structure	41
2.1.5	The covariance pattern model covariance structure	43
2.2	Model Fitting Methods	45
2.2.1	The likelihood function and approaches to its maximisation	45
2.2.2	Estimation of fixed effects	49
2.2.3	Estimation (or prediction) of random effects and coefficients	50
2.2.4	Estimation of variance parameters	52
2.3	The Bayesian Approach	56
2.3.1	Introduction	57
2.3.2	Determining the posterior density	58
2.3.3	Parameter estimation, probability intervals and p -values	59
2.3.4	Specifying non-informative prior distributions	61
2.3.5	Evaluating the posterior distribution	66
2.4	Practical Application and Interpretation	70
2.4.1	Negative variance components	70
2.4.2	Accuracy of variance parameters	74
2.4.3	Bias in fixed and random effects standard errors	75
2.4.4	Significance testing	76
2.4.5	Confidence intervals	79
2.4.6	Model checking	79
2.4.7	Missing data	81
2.5	Example	83
2.5.1	Analysis models	83
2.5.2	Results	85
2.5.3	Discussion of points from Section 2.4	87
3	Generalised Linear Mixed Models	107
3.1	Generalised Linear Models	108
3.1.1	Introduction	108
3.1.2	Distributions	109
3.1.3	The general form for exponential distributions	111
3.1.4	The GLM definition	112
3.1.5	Fitting the GLM	115

3.1.6	Expressing individual distributions in the general exponential form	117
3.1.7	Conditional logistic regression	119
3.2	Generalised Linear Mixed Models	120
3.2.1	The GLMM definition	120
3.2.2	The likelihood and quasi-likelihood functions	121
3.2.3	Fitting the GLMM	124
3.3	Practical Application and Interpretation	128
3.3.1	Specifying binary data	128
3.3.2	Uniform effects categories	129
3.3.3	Negative variance components	130
3.3.4	Fixed and random effects estimates	130
3.3.5	Accuracy of variance parameters and random effects shrinkage	131
3.3.6	Bias in fixed and random effects standard errors	132
3.3.7	The dispersion parameter	133
3.3.8	Significance testing	135
3.3.9	Confidence intervals	136
3.3.10	Model checking	136
3.4	Example	137
3.4.1	Introduction and models fitted	137
3.4.2	Results	139
3.4.3	Discussion of points from Section 3.3	142
4	Mixed Models for Categorical Data	153
4.1	Ordinal Logistic Regression (Fixed Effects Model)	153
4.2	Mixed Ordinal Logistic Regression	158
4.2.1	Definition of the mixed ordinal logistic regression model	158
4.2.2	Residual variance matrix	159
4.2.3	Alternative specification for random effects models	161
4.2.4	Likelihood and quasi-likelihood functions	162
4.2.5	Model fitting methods	162
4.3	Mixed Models for Unordered Categorical Data	163
4.3.1	The G matrix	165
4.3.2	The R matrix	166
4.3.3	Fitting the model	166
4.4	Practical Application and Interpretation	166
4.4.1	Expressing fixed and random effects results	167
4.4.2	The proportional odds assumption	167
4.4.3	Number of covariance parameters	167
4.4.4	Choosing a covariance pattern	168
4.4.5	Interpreting covariance parameters	168
4.4.6	Checking model assumptions	168

4.4.7	The dispersion parameter	168
4.4.8	Other points	168
4.5	Example	169
5	Multi-Centre Trials and Meta-Analyses	183
5.1	Introduction to Multi-Centre Trials	183
5.1.1	What is a multi-centre trial?	183
5.1.2	Why use mixed models to analyse multi-centre data?	184
5.2	The Implications of using Different Analysis Models	184
5.2.1	Centre and centre-treatment effects fixed	184
5.2.2	Centre effects fixed, centre-treatment effects omitted	185
5.2.3	Centre and centre-treatment effects random	186
5.2.4	Centre effects random, centre-treatment effects omitted	187
5.3	Example: A Multi-Centre Trial	188
5.4	Practical Application and Interpretation	195
5.4.1	Plausibility of a centre-treatment interaction	195
5.4.2	Generalisation	195
5.4.3	Number of centres	196
5.4.4	Centre size	196
5.4.5	Negative variance components	196
5.4.6	Balance	197
5.5	Sample Size Estimation	197
5.5.1	Normal data	197
5.5.2	Non-normal data	201
5.6	Meta-Analysis	203
5.7	Example: Meta-analysis	204
5.7.1	Analyses	204
5.7.2	Results	205
5.7.3	Treatment estimates in individual trials	206
6	Repeated Measures Data	215
6.1	Introduction	215
6.1.1	Reasons for repeated measurements	215
6.1.2	Analysis objectives	216
6.1.3	Fixed effects approaches	216
6.1.4	Mixed models approaches	217
6.2	Covariance Pattern Models	218
6.2.1	Covariance patterns	219
6.2.2	Choice of covariance pattern	223
6.2.3	Choice of fixed effects	225
6.2.4	General points	226
6.3	Example: Covariance Pattern Models for Normal Data	228

- 6.3.1 Analysis models 229
- 6.3.2 Selection of covariance pattern 229
- 6.3.3 Assessing fixed effects 231
- 6.3.4 Model checking 231
- 6.4 Example: Covariance Pattern Models for Count Data 237
 - 6.4.1 Analysis models 238
 - 6.4.2 Analysis using a categorical mixed model 242
- 6.5 Random Coefficients Models 245
 - 6.5.1 Introduction 245
 - 6.5.2 General points 247
 - 6.5.3 Comparisons with fixed effects approaches 249
- 6.6 Examples of Random Coefficients Models 249
 - 6.6.1 A linear random coefficients model 250
 - 6.6.2 A polynomial random coefficients model 252
- 6.7 Sample Size Estimation 267
 - 6.7.1 Normal data 267
 - 6.7.2 Non-normal data 269
 - 6.7.3 Categorical data 270

7 Cross-Over Trials 271

- 7.1 Introduction 271
- 7.2 Advantages of Mixed Models in Cross-Over Trials 272
- 7.3 The AB/BA Cross-Over Trial 272
 - 7.3.1 Example: AB/BA cross-over design 275
- 7.4 Higher Order Complete Block Designs 279
 - 7.4.1 Inclusion of carry-over effects 279
 - 7.4.2 Example: four-period, four-treatment cross-over trial 279
- 7.5 Incomplete Block Designs 284
 - 7.5.1 The three-treatment, two-period design (Koch's design) 284
 - 7.5.2 Example: two-period cross-over trial 285
- 7.6 Optimal Designs 287
 - 7.6.1 Example: Balaam's design 287
- 7.7 Covariance Pattern Models 290
 - 7.7.1 Structured by period 290
 - 7.7.2 Structured by treatment 290
 - 7.7.3 Example: four-way cross-over trial 291
- 7.8 Analysis of Binary Data 299
- 7.9 Analysis of Categorical Data 303
- 7.10 Use of Results from Random Effects Models in Trial Design 307
 - 7.10.1 Example 308
- 7.11 General Points 308

8 Other Applications of Mixed Models	311
8.1 Trials with Repeated Measurements within Visits	311
8.1.1 Covariance pattern models	312
8.1.2 Example	317
8.1.3 Random coefficients models	323
8.1.4 Example: random coefficients models	325
8.2 Multi-Centre Trials with Repeated Measurements	330
8.2.1 Example: multi-centre hypertension trial	331
8.2.2 Covariance pattern models	332
8.3 Multi-Centre Cross-Over Trials	337
8.4 Hierarchical Multi-Centre Trials and Meta-Analysis	338
8.5 Matched Case–Control Studies	339
8.5.1 Example	339
8.5.2 Analysis of a quantitative variable	340
8.5.3 Check of model assumptions	342
8.5.4 Analysis of binary variables	343
8.6 Different Variances for Treatment Groups in a Simple Between-Patient Trial	351
8.6.1 Example	352
8.7 Estimating Variance Components in an Animal Physiology Trial	355
8.7.1 Sample size estimation for a future experiment	356
8.8 Inter- and Intra-Observer Variation in Foetal Scan Measurements	361
8.9 Components of Variation and Mean Estimates in a Cardiology Experiment	363
8.10 Cluster Sample Surveys	365
8.10.1 Example: cluster sample survey	365
8.11 Small Area Mortality Estimates	367
8.12 Estimating Surgeon Performance	371
8.13 Event History Analysis	372
8.13.1 Example	373
8.14 A Laboratory Study Using a Within-Subject 4×4 Factorial Design	375
8.15 Bioequivalence Studies with Replicate Cross-Over Designs	378
8.15.1 Example	383
8.16 Cluster Randomised Trials	392
8.16.1 Example: a trial to evaluate integrated care pathways for treatment of children with asthma in hospital	392
8.16.2 Example: Edinburgh randomised trial of breast screening	395

9 Software for Fitting Mixed Models	401
9.1 Packages for Fitting Mixed Models	401
9.2 Basic use of PROC MIXED	403
9.3 Using SAS to Fit Mixed Models to Non-Normal Data	423
9.3.1 PROC GLIMMIX	423
9.3.2 PROC GENMOD	428
Glossary	431
References	435
Index	441
