1 Geometry and Energetics

- 1.1 Supramolecular Interactions: Energetic Considerations 1**
Angelo Gavezzotti
- 1.1.1 Introduction 1
- 1.1.2 Enthalpy 2
- 1.1.2.1 The Quantistic Approach: Molecular Orbital (MO) Theory 2
- 1.1.2.2 The Quantistic Approach: Density Functional Theory (DFT) 5
- 1.1.2.3 The Quantistic Approach: the Crystal Orbital Method 5
- 1.1.2.4 The Classical Approach: Vibrational and Nonbonded (“Force Field”) Energies 7
- 1.1.2.5 Semi-classical Approaches: the SCDS-Pixel Method 10
- 1.1.2.6 Supramolecular Energies 12
- 1.1.3 Entropy 13
- 1.1.3.1 Statistical and Classical Entropy 13
- 1.1.3.2 Lattice Dynamics [15] and Lattice Vibration Frequencies 15
- 1.1.3.3 Entropy and Dynamic Simulation 16
- 1.1.4 Free Energy 16
- 1.1.4.1 Complexation and Evaporation/Sublimation 16
- 1.1.4.2 Melting and Polymorphism 17
- 1.1.5 Tutorial Examples 18
- 1.1.5.1 Dimerization Energies, a Scale of Intermolecular Interactions 18
- 1.1.5.2 Calculation of Lattice Energies, Force Field Methods versus Pixel 19
- 1.1.5.3 Energy Partitioning by Pixel 20
- 1.1.5.4 Analysis of Crystal Structures 21
- 1.2 Understanding the Nature of the Intermolecular Interactions in Molecular Crystals. A Theoretical Perspective 25**
Juan J. Novoa, Emiliana D’Oria, and Maria A. Carvajal
- 1.2.1 Introduction 25
- 1.2.2 Intermolecular Interactions 26
- 1.2.2.1 Interactions and Bonds: When Do Intermolecular Interactions Become Bonds? 29
- 1.2.2.2 The Nature of the Intermolecular Interactions 34

1.2.2.3	Types of Intermolecular Interactions and Intermolecular Bonds Found in Molecular Crystals	39
1.2.2.4	Hydrogen Bonds	45
1.2.2.5	Existence of Intermolecular Bonds in Crystals	46
1.2.2.6	Intermolecular Bonds in Crystals	51
1.2.3	Summary	54
1.3	Networks, Topologies, and Entanglements	58
	<i>Lucia Carlucci, Gianfranco Ciani, and Davide M. Proserpio</i>	
1.3.1	Introduction	58
1.3.2	Rationalization and Simplification of the Extended Structures	59
1.3.3	Topological Classification of Networks	61
1.3.3.1	Nomenclature for Single Nets: Schläfli and Vertex Symbols	61
1.3.3.2	Tiling Theory and Topological Approaches to Making Crystals	67
1.3.3.3	Self-catenated Networks	69
1.3.4	Entangled Systems	70
1.3.4.1	Types of Entanglements	70
1.3.4.2	Interpenetrating Networks	72
1.3.4.3	Polycatenated Networks	75
1.3.4.4	Borromean Networks	78
1.3.4.5	Other Entanglements	79
1.3.5	Conclusions	80
2	Design and Reactivity	
2.1	Prediction of Reactivity in Solid-state Chemistry	87
	<i>Gerd Kaupp</i>	
2.1.1	Introduction	87
2.1.2	Topochemistry and Topotaxy	88
2.1.3	Far-reaching Molecular Migrations in Solid-state Reactions (AFM, GID, SNOM) and Experimental Solid-state Mechanism	90
2.1.4	Face Selectivity of Reactivity	102
2.1.5	Some of the Important Failures of Topochemistry and Their Remedy by the Experimental Mechanism	105
2.1.6	Molecular Migrations in the Absence of Severe Local Pressure	111
2.1.7	Multiple Cleavage Planes	115
2.1.8	Various Types of Cleavage Planes	117
2.1.9	Channels	121
2.1.10	Closed Voids	133
2.1.11	Interpretation of Some Recent Literature Data	134
2.1.12	Applications in Addition to Solid-state Syntheses	138
2.1.13	Conclusions and Outlook	143
2.2	Making Crystals by Reacting Crystals	149
	<i>Fumio Toda</i>	
2.2.1	Introduction	149

2.2.2	Thermal Solid-state Reactions	150
2.2.2.1	Crystal–Crystal Reactions	150
2.2.2.2	Reactions in Crystals	153
2.2.2.3	Solid–Solid Reactions in the Presence of Solvent Vapor	156
2.2.3	Making Inclusion Complex Crystals by Mixing or Grinding Host and Guest Crystals	160
2.2.3.1	Formation of Host–Guest Inclusion Complexes and Stereoselective Photochemical Reactions of the Guest in the Solid State	160
2.2.3.2	Enantioselective Inclusion Complexation in the Solid State	165
2.2.4	Making Crystals by Phase Transition	167
2.2.4.1	Phase Transition from Photochemically Nonreactive Inclusion Complexes to Reactive Ones	167
2.2.4.2	Phase Transition from Optically Active Complexes to <i>Rac</i> -Ones in Crystals	170
2.2.4.3	Phase Transition from the <i>Rac</i> -Inclusion Complex to the Conglomerate One	170
2.2.5	Control of Differential Inclusion Complexation by Seed Crystals	171
2.2.6	Conclusions	174
2.3	Making Crystals by Reactions in Crystals. Supramolecular Approaches to Crystal-to-Crystal Transformations within Molecular Co-Crystals	176
	<i>Tomislav Friščić and Leonard R. MacGillivray</i>	
2.3.1	Introduction	176
2.3.2	Single-component Solids	177
2.3.2.1	[2+2] Photodimerizations	177
2.3.2.2	[2+2] Photopolymerizations	178
2.3.2.3	Diacetylene and Triacetylene Polymerizations	179
2.3.3	Co-crystals	181
2.3.3.1	[2+2] Photodimerization	181
2.3.4	SCSC Reactivity by Modifying Experimental Conditions	188
2.3.5	Conclusion	190
2.4	Making Coordination Frameworks	193
	<i>Neil R. Champness</i>	
2.4.1	Introduction	193
2.4.2	Coordination Framework Design Criteria	193
2.4.3	Coordination Polymer Design Approaches	194
2.4.3.1	The Building-block Methodology	194
2.4.3.2	Complications: An Inclusive Building-block Methodology	197
2.4.3.3	Porosity and Interpenetration	200
2.4.4	Synthetic Considerations and Approaches	202
2.4.5	Structural Evaluation and Analysis	204
2.4.6	Structural Description	205
2.4.7	Conclusions	206

2.5	Assembly of Molecular Solids via Non-covalent Interactions	209
	<i>Christer B. Aakeröy and Nate Schultheiss</i>	
2.5.1	Introduction	209
2.5.1.1	How Do We Design, Engineer and Build a Molecular Crystal?	209
2.5.1.2	The Power of Covalent Synthesis	209
2.5.1.3	The Case for Supramolecular Chemistry	210
2.5.2	Directed Assembly of Homomeric Molecular Solids	211
2.5.2.1	Hydrogen-bond Interactions – Essential Tools for Constructing Molecular Solids	211
2.5.2.2	Hydrogen-bond-based Assemblies	212
2.5.2.3	Halogen-bond-based Assembly Strategies	216
2.5.3	Design and Synthesis of Co-crystals	218
2.5.3.1	Background	218
2.5.3.2	Developing Hydrogen-bond Design Strategies for Synthesis of Co-crystals	220
2.5.3.3	Examples of Binary Hydrogen-bonded Co-crystals	224
2.5.3.4	From Pattern Recognition to Practical Crystal Engineering	225
2.5.3.5	Synthesis of Co-crystals and the Supramolecular Yield	225
2.5.3.6	Heteromeric Interactions are Better than Homomeric Interactions	226
2.5.3.7	Do Polymorphic Compounds Make Good Co-crystallizing Agents?	227
2.5.3.8	Beyond Binary Co-crystals: The Need for Supramolecular Reagents	230
2.5.3.9	Codicil	235

3 Characterizations and Applications

3.1	Diffraction Studies in Crystal Engineering	241
	<i>Guillermo Mínguez Espallargas and Lee Brammer</i>	
3.1.1	Introduction	241
3.1.2	Scope	242
3.1.3	Single Crystal X-ray Diffraction	243
3.1.3.1	Experimental Method	243
3.1.3.2	What Information Can Be Obtained and How Reliable Is It?	244
3.1.3.3	Limitations	245
3.1.4	Single crystal neutron diffraction	246
3.1.4.1	Experimental Method	246
3.1.4.2	What Information Can Be Obtained and How Reliable Is It?	247
3.1.5	Single Crystal Diffraction Studies at Low Temperatures	248
3.1.5.1	Hydrogen Bonds	250
3.1.5.2	Other Non-covalent Interactions	251
3.1.5.3	Other Applications	253
3.1.6	Single Crystal Diffraction Studies at Increased Pressures	253
3.1.6.1	Experimental Method and Applications	253
3.1.6.2	Intermolecular Interactions	255
3.1.6.3	Polymorphism	256

3.1.7	Powder Diffraction	258
3.1.7.1	Crystal Structure Determination	258
3.1.7.2	Crystal Structures of Organic Compounds	259
3.1.7.3	Crystal Structures and Reactions of Metal–Organic Compounds	261
3.1.8	Charge Density Studies	262
3.1.9	Conclusions	263
3.2	Solid State NMR	266
	<i>Roberto Gobetto</i>	
3.2.1	Introduction	266
3.2.2	The Fundamentals	267
3.2.2.1	Quadrupole Interaction	267
3.2.2.2	Dipolar Interaction	269
3.2.2.3	The Shielding Term (H_S) or Chemical Shift Anisotropy (CSA)	274
3.2.2.4	Line Narrowing in the Solid State	274
3.2.2.5	Dipolar Decoupling	275
3.2.3	CPMAS	276
3.2.4	Advantages and Disadvantages of Solid State NMR Spectroscopy	278
3.2.5	Polymorphism	278
3.2.6	Resolution of Enantiomers by Solid State NMR	282
3.2.7	Distances Determined by SSNMR	283
3.2.8	Hydrogen Bond	285
3.3	Crystal Polymorphism: Challenges at the Crossroads of Science and Technology	293
	<i>Dario Braga and Joel Bernstein</i>	
3.3.1	Introduction	293
3.3.1.1	What Are Polymorphism and the Multiplicity of Crystal Forms?	293
3.3.1.2	Why Are Polymorphism and Multiple Crystal Forms Important?	295
3.3.2	How Do We Detect and Characterize Multiple Crystal Forms?	296
3.3.3	New Developments in Detecting and Characterizing Multiple Crystal Forms	300
3.3.4	Examples of Crystal Form Identification and Characterization	301
3.3.5	Practical Implications and Ramifications of Multiple Crystal Forms – Pharmaceuticals	308
3.3.6	Conclusions	312
3.4	Nanoporosity, Gas Storage, Gas Sensing	315
	<i>Satoshi Takamizawa</i>	
3.4.1	Introduction	315
3.4.2	Description of Porosity	315
3.4.3	Nanoporosity for Gas Adsorption	317
3.4.4	Brief Thermodynamic Description of the Gas Adsorption Phenomenon	318
3.4.5	Crystalline Organic and Metal–Organic Gas Adsorbents	321
3.4.6	Dawn of Metal–Organic Gas Adsorbents	323

3.4.7	Design of Porosity in Coordination Polymer Systems	323
3.4.8	Structural Description and Dimensionality of the Host Component	324
3.4.9	Transformation of a Single-crystal Gas Adsorbent during Gas Adsorption	325
3.4.10	Abnormal Guest Diffusivity Within Pores	327
3.4.11	Method for the Accurate Detection and Measurement of the Gas Adsorbed State	329
3.4.12	Hydrogen Storage [21]	331
3.4.13	Phase Transition of the Adsorbed Guest Sublattice in the Gas Inclusion Co-crystal State [23]	332
3.4.14	Dynamic Change in Pore Topology by Design of Host Flexibility [24]	333
3.4.15	Mass-induced Phase Transition [24]	334
3.4.16	Sensing Gas by Porous Crystals	336
3.4.17	Concluding Remarks	337
