

Contents

Foreword *VIII*

Preface *IX*

Part I Basic Aspects

- 1 **Some Introductory Concepts in Tumor Biology:
Clonal Evolution and Autonomy versus Non-autonomy of Cancer Cells** 3
- 2 **The Cell's Life and Death: Cell Cycle, Senescence and Apoptosis** 5

Part II Genes Involved in Carcinogenesis

- 3 **Oncogenes** 17
- 4 **Tumor-suppressor Genes** 27
- 5 **Genomic Instability** 40
- 6 **A Twist in the (Genetic) Tail: Cancer Epigenetics** 48
- 7 **Nonautonomous Interactions in Carcinogenesis:
Role of the Tumor Stroma** 59
- 8 **Telomerase and Cellular Immortality** 65
- 9 **Tumor Angiogenesis** 70
- 10 **Metastasis** 80

vi | Contents

Part III Specific Topics

- 11 Tissue Context as a Determinant of the Tumor-suppressive or Oncogenic Function of Certain Genes 91
- 12 Cancer Stem Cells 97
- 13 Determination of Therapeutic Efficacy – Pharmacogenomics 102
- 14 Certain Chemicals Induce Cancer: Chemical Carcinogenesis 110
- 15 Hormones and Cancer 113
- 16 Viral Oncogenesis 123

Part IV Unifying the Concepts

- 17 Cooperation of Multiple Biological Processes is Needed for the Development of Fully Fledged Malignancy 133
- 18 Carcinogenesis *In Vivo*: Animal Models and Basic Approaches to Generate Genetically Modified Animals 136
- 19 Multistage Carcinogenesis in Humans: Molecular Epidemiology and the Colon Cancer Model 160

Part V Future Perspectives

- 20 Epilogue 169
- Index 171
