Preface	xix
List of abbreviations	xxv
List of symbols	xxxix
PART I INTRODUCTION	1
1 Applications and requirements of wireless services	3
1.1 History	4
1.1.1 How it all started	4
1.1.2 The first systems	4
1.1.3 Analog cellular systems	5
1.1.4 GSM, and the worldwide cellular revolution	6
1.1.5 New wireless systems and the burst of the bubble	7
1.1.6 Wireless revival	8
1.2 Types of services	8
1.2.1 Broadcast	8
1.2.2 Paging	9
1.2.3 Cellular telephony	10
1.2.4 Trunking radio	11
1.2.5 Cordless telephony	12
1.2.6 Wireless local area networks and personal area networks	13
1.2.7 Personal area networks	14
1.2.8 Fixed wireless access	14
1.2.9 Satellite cellular communications	15
1.3 Requirements for the services	16
1.3.1 Data rate	16
1.3.2 Range and number of users	17
1.3.3 Mobility	17
1.3.4 Energy consumption	18
1.3.5 Use of spectrum	20
1.3.6 Direction of transmission	21
1.3.7 Service quality	21

1.4	Economic and social aspects	22
1.4.1	Economic requirements for building wireless communications systems	22
1.4.2	The market for wireless communications	22
1.4.3	Behavioral impact	24
2	Technical challenges of wireless communications	25
2.1	Multipath propagation	25
2.1.1	Fading	27
2.1.2	Intersymbol interference	29
2.2	Spectrum limitations	30
2.2.1	Assigned frequencies	30
2.2.2	Frequency reuse in regulated spectrum	32
2.2.3	Frequency reuse in unregulated spectrum	33
2.3	Limited energy	33
2.4	User mobility	34
3	Noise- and interference-limited systems	35
3.1	Introduction	35
3.2	Noise-limited systems	35
3.2.1	Link budget	38
3.3	Interference-limited systems	40
PART II WIRELESS PROPAGATION CHANNELS		43
4	Propagation mechanisms	45
4.1	Free space loss	45
4.2	Reflection and transmission	47
4.2.1	Snell's law	47
4.2.2	Reflection and transmission for layered dielectric structures	48
4.2.3	The d^{-4} power law	51
4.3	Diffraction	52
4.3.1	Diffraction by a single screen or wedge	52
4.3.2	Diffraction by multiple screens	57
4.4	Scattering by rough surfaces	61
4.4.1	The Kirchhoff theory	62
4.4.2	Perturbation theory	62
4.5	Waveguiding	64
<i>Appendix material: please see companion website (www.wiley.com/go/molisch)</i>		
4.A	Derivation of the d^{-4} law	
4.B	Diffraction coefficients for diffraction by a wedge or cylinder	
	Further reading	64
5	Statistical description of the wireless channel	65
5.1	Introduction	65
5.2	The time-invariant two-path model	67
5.3	The time-variant two-path model	68
5.4	Small-scale fading without a dominant component	70
5.4.1	A computer experiment	70
5.4.2	Mathematical derivation of the statistics of amplitude and phase	71

5.4.3	Properties of the Rayleigh distribution	75
5.4.4	Fading margin for Rayleigh-distributed fieldstrength	77
5.5	Small-scale fading with a dominant component	78
5.5.1	A computer experiment	78
5.5.2	Derivation of the amplitude and phase distribution	78
5.5.3	Nakagami distribution	82
5.6	Doppler spectra	83
5.7	Temporal dependence of fading	85
5.7.1	Level crossing rate	85
5.7.2	Average duration of fades	86
5.7.3	Random frequency modulation	88
5.8	Large-scale fading	89
	<i>Appendix material: please see companion website (www.wiley.com/go/molisch)</i>	
5.A	The Lindeberg–Feller theorem	
5.B	Derivation of Rayleigh distribution	
5.C	Derivation of the level crossing rate	
	Further reading	93
6	Wideband and directional channel characterization	95
6.1	Introduction	95
6.2	The causes of delay dispersion	96
6.2.1	The two-path model	96
6.2.2	The general case	97
6.3	System-theoretic description of wireless channels	99
6.3.1	Characterization of deterministic linear time-variant systems	100
6.3.2	Stochastic system functions	101
6.4	The WSSUS model	103
6.4.1	Wide-sense stationarity	103
6.4.2	Uncorrelated scatterers	104
6.4.3	WSSUS assumption	104
6.4.4	Tapped delay line models	105
6.5	Condensed parameters	106
6.5.1	Integrals of the correlation functions	106
6.5.2	Moments of the power delay profile	106
6.5.3	Moments of the Doppler spectra	107
6.5.4	Coherence bandwidth and coherence time	108
6.5.5	Window parameters	110
6.6	Ultrawideband channels	112
6.7	Directional description	113
	<i>Appendix material: please see companion website (www.wiley.com/go/molisch)</i>	
6.A	Validity of WSSUS in mobile radio channels	
6.B	Instantaneous channel parameters	
	Further reading	116
7	Channel models	117
7.1	Introduction	117
7.2	Narrowband models	119
7.2.1	Modeling of small-scale and large-scale fading	119
7.2.2	Pathloss models	119

7.3	Wideband models	120
7.3.1	Tapped delay line models	120
7.3.2	Models for the power delay profile	121
7.3.3	Models for the arrival times of rays and clusters	122
7.3.4	Standardized channel model	123
7.4	Directional models	124
7.4.1	General model structure and factorization	124
7.4.2	Angular dispersion at the base station	125
7.4.3	Angular dispersion at the mobile station	125
7.4.4	Polarization	125
7.4.5	Model implementations	126
7.4.6	Standardized directional models	128
7.4.7	Multiple-input multiple-output matrix models	129
7.5	Deterministic channel-modeling methods	130
7.5.1	Ray launching	131
7.5.2	Ray tracing	132
7.5.3	Efficiency considerations	133
7.5.4	Geographical databases	134
<i>Appendix material:</i> please see companion website (www.wiley.com/go/molisch)		
7.A	The Okumura–Hata model	
7.B	The COST 231–Walfish–Ikegami model	
7.C	The COST 207 GSM model	
7.D	The ITU-R models	
	Further reading	135
8	Channel sounding	137
8.1	Introduction	137
8.1.1	Requirements for channel sounding	137
8.1.2	Generic sounder structure	137
8.1.3	Identifiability of wireless channels	139
8.1.4	Influence on measurement data	141
8.2	Time domain measurements	142
8.2.1	Impulse sounder	142
8.2.2	Correlative sounders	143
8.3	Frequency domain analysis	144
8.4	Modified measurement methods	145
8.4.1	Swept Time Delay Cross Correlator (STDCC)	145
8.4.2	Inverse filtering	146
8.4.3	Averaging	146
8.4.4	Synchronization	147
8.4.5	Vector network analyzer measurements	148
8.5	Directionally resolved measurements	149
8.5.1	Data model for receive arrays	150
8.5.2	Beamforming	152
8.5.3	High-resolution algorithms	152
8.5.4	Multiple-input multiple-output measurements	154
<i>Appendix material:</i> please see companion website (www.wiley.com/go/molisch)		
8.A	The ESPRIT algorithm	
	Further reading	156

9	Antennas	157
9.1	Introduction	157
9.1.1	Integration of antennas into systems	157
9.1.2	Characteristic antenna quantities	157
9.2	Antennas for mobile stations	161
9.2.1	Monopole and dipole antennas	161
9.2.2	Helical antennas	162
9.2.3	Microstrip antennas	162
9.2.4	Planar inverted-F antenna	164
9.2.5	Radiation-coupled dual-L antenna	165
9.2.6	Multiband antennas	165
9.2.7	Antenna mounting on the mobile station	166
9.3	Antennas for base stations	166
9.3.1	Types of antennas	166
9.3.2	Array antennas	167
9.3.3	Modifying the antenna pattern	168
9.3.4	Impact of the environment on antenna pattern	168
	Further reading	169
 PART III TRANSCEIVERS AND SIGNAL PROCESSING		 171
10	Structure of a wireless communication link	173
10.1	Transceiver block structure	173
10.2	Simplified models	178
	Further reading	178
11	Modulation formats	179
11.1	Introduction	179
11.2	Basics	180
11.2.1	Pulse amplitude modulation	180
11.2.2	Multipulse modulation and continuous phase modulation	184
11.2.3	Power spectrum	185
11.2.4	Signal space diagram	186
11.3	Important modulation formats	188
11.3.1	Binary phase shift keying	188
11.3.2	Quadrature-phase shift keying	191
11.3.3	$\pi/4$ -differential quadrature-phase shift keying	193
11.3.4	Offset quadrature-phase shift keying	196
11.3.5	Higher order modulation	197
11.3.6	Binary frequency shift keying	200
11.3.7	Minimum shift keying	202
11.3.8	Demodulation of minimum shift keying	205
11.3.9	Gaussian minimum shift keying	206
11.3.10	Pulse position modulation	206
11.3.11	Summary of spectral efficiencies	209
	<i>Appendix material: please see companion website (www.wiley.com/go/molisch)</i>	
11.A	Interpretation of MSK as OQPSK	
	Further reading	210

12 Demodulation	211
12.1 Demodulator structure and error probability in additive-white-Gaussian-noise channels	211
12.1.1 Model for channel and noise	211
12.1.2 Signal space diagram and optimum receivers	212
12.1.3 Methods for the computation of error probability	215
12.2 Error probability in flat-fading channels	221
12.2.1 Average BER – classical computation method	221
12.2.2 Computation of average error probability – alternative method	224
12.2.3 Outage probability versus average error probability	227
12.3 Error probability in delay- and frequency-dispersive fading channels	228
12.3.1 Physical cause of error floors	228
12.3.2 Computation of the error floor using the group delay method	232
12.3.3 General fading channels: the quadratic-form-Gaussian-variable method	235
Further reading	237
13 Diversity	239
13.1 Introduction	239
13.1.1 Principle of diversity	239
13.1.2 Definition of the correlation coefficient	240
13.2 Microdiversity	240
13.2.1 Spatial diversity	242
13.2.2 Temporal diversity	245
13.2.3 Frequency diversity	245
13.2.4 Angle diversity	246
13.2.5 Polarization diversity	247
13.3 Macrodiversity and simulcast	248
13.4 Combination of signals	249
13.4.1 Selection diversity	250
13.4.2 Switched diversity	252
13.4.3 Combining diversity	253
13.5 Error probability in fading channels with diversity reception	257
13.5.1 Error probability in flat-fading channels	257
13.5.2 Symbol error rate in frequency-selective fading channels	259
13.6 Transmit diversity	262
13.6.1 Transmitter diversity with channel-state information	262
13.6.2 Transmitter diversity without channel-state information	262
<i>Appendix material: please see companion website (www.wiley.com/go/molisch)</i>	
13.A Correlation coefficient of two signals with time separation and frequency separation	
Further reading	263
14 Channel coding	265
14.1 Introduction	265
14.1.1 History and motivation	265
14.1.2 Classification of codes	266
14.2 Block codes	267
14.2.1 Introduction	267
14.2.2 Encoding	268
14.2.3 Decoding	269

14.2.4	Recognition and correction of errors	270
14.2.5	Concatenated codes	272
14.2.6	Cyclic block codes	272
14.2.7	Examples for cyclic block codes	273
14.3	Convolutional codes	275
14.3.1	Principle of convolutional codes	275
14.3.2	Viterbi decoder – classical representation	276
14.3.3	Improvements of the Viterbi algorithm	278
14.4	Trellis-coded modulation	281
14.4.1	Basic principle	281
14.4.2	Set partitioning	283
14.5	Turbocodes	285
14.5.1	Introduction	285
14.5.2	Encoder	285
14.5.3	Turbodecoder	287
14.6	Low-density parity check codes	288
14.6.1	Definition of low-density parity check codes	289
14.6.2	Encoding of low-density parity check codes	290
14.6.3	Decoding of low-density parity check codes	290
14.6.4	Performance improvements	293
14.7	Coding for the fading channel	294
14.7.1	Interleaving	294
14.7.2	Block codes	296
14.7.3	Convolutional codes	297
14.7.4	Concatenated codes	298
14.7.5	Trellis-coded modulation in fading channels	298
<i>Appendix material: please see companion website (www.wiley.com/go/molisch)</i>		
14.A	Backward error correction	
	Further reading	299
15	Speech coding	301
<i>Gernot Kubin, Graz University of Technology, Austria</i>		
15.1	Introduction	301
15.1.1	Speech telephony as conversational multimedia service	301
15.1.2	Source-coding basics	301
15.1.3	Speech coder designs	302
15.2	The sound of speech	304
15.2.1	Speech production	304
15.2.2	Speech acoustics	305
15.2.3	Speech perception	307
15.3	Stochastic models for speech	308
15.3.1	Short-time stationary modeling	308
15.3.2	Linear predictive vocoder	309
15.3.3	Sinusoidal modeling	311
15.3.4	Harmonic + noise modeling	312
15.3.5	Cyclostationary modeling	312
15.4	Quantization and coding	313
15.4.1	Scalar quantization	313
15.4.2	Vector quantization	314
15.4.3	Noise shaping in predictive coding	317

15.4.4	Analysis-by-synthesis	319
15.4.5	Joint source channel coding	320
15.5	From speech transmission to acoustic telepresence	321
15.5.1	Voice activity detection	322
15.5.2	Receiver end enhancements	322
15.5.3	Acoustic echo and noise	323
15.5.4	Service augmentation for telepresence	323
	Further reading	324
16	Equalizers	325
16.1	Introduction	325
16.1.1	Equalization in the time domain and frequency domain	325
16.1.2	Modeling of channel and equalizer	326
16.1.3	Channel estimation	327
16.2	Linear equalizers	328
16.2.1	Zero-forcing equalizer	329
16.2.2	The mean-square error criterion	330
16.2.3	Adaptation algorithms for mean-square-error equalizers	332
16.2.4	Further linear structures	335
16.3	Decision feedback equalizers	335
16.3.1	MMSE decision feedback equalizer	336
16.3.2	Zero-forcing decision feedback equalizer	336
16.4	Maximum-likelihood sequence estimation – Viterbi detector	337
16.5	Comparison of equalizer structures	339
16.6	Fractionally spaced equalizers	340
16.7	Blind equalizers	341
16.7.1	Introduction	341
16.7.2	Constant modulus algorithm	341
16.7.3	Blind maximum-likelihood estimation	342
16.7.4	Algorithms using second- or higher order statistics	342
16.7.5	Assessment	343
	<i>Appendix material: please see companion website (www.wiley.com/go/molisch)</i>	
16.A	Equivalence of peak distortion and zero-forcing criterion	
16.B	Derivation of the mean-square-error criterion	
16.C	The recursive-least-squares algorithm	
	Further reading	343
PART IV	MULTIPLE ACCESS AND ADVANCED TRANSCEIVER SCHEMES	345
17	Multiple access and the cellular principle	347
17.1	Introduction	347
17.2	Frequency division multiple access	348
17.2.1	Multiple access via frequency division multiple access	348
17.2.2	Trunking gain	349
17.3	Time division multiple access	353
17.4	Packet radio	355
17.4.1	ALOHA	355
17.4.2	Carrier-sense multiple access	357
17.4.3	Packet reservation multiple access	357

17.4.4	Comparison of the methods	358
17.4.5	Routing for packet radio	359
17.5	Duplexing	360
17.6	Principles of cellular networks	361
17.6.1	Reuse distance	361
17.6.2	Cellshape	362
17.6.3	Cell planning with hexagonal cells	363
17.6.4	Methods for increasing capacity	365
<i>Appendix material: please see companion website (www.wiley.com/go/molisch)</i>		
17.A	Adjacent channel interference	
Further reading		367
18	Spread spectrum systems	369
18.1	Frequency-hopped multiple access	369
18.1.1	Principle behind frequency hopping	369
18.1.2	Frequency Hopping for Multiple Access (FHMA)	370
18.2	Code division multiple access	372
18.2.1	Basic principle behind the direct-sequence spread spectrum	372
18.2.2	Multiple access	374
18.2.3	Mathematical representation	375
18.2.4	Effects of multipath propagation on code division multiple access	376
18.2.5	Synchronization	379
18.2.6	Code families	380
18.3	Cellular code-division-multiple-access systems	383
18.3.1	Principle behind code division multiple access – revisited	383
18.3.2	Power control	385
18.3.3	Methods for capacity increases	387
18.3.4	Combination with other multiaccess methods	388
18.4	Multiuser detection	388
18.4.1	Introduction	388
18.4.2	Linear multiuser detectors	389
18.4.3	Nonlinear multiuser detectors	390
18.5	Time-hopping impulse radio	392
18.5.1	Simple impulse radio	393
18.5.2	Time-hopping impulse radio	393
18.5.3	Impulse radio in delay-dispersive channels	396
Further reading		397
19	Orthogonal frequency division multiplexing (OFDM)	399
19.1	Introduction	399
19.2	Principle of orthogonal frequency division multiplexing	400
19.3	Implementation of transceivers	400
19.4	Frequency-selective channels	402
19.4.1	Cyclic prefix	402
19.4.2	Performance in frequency-selective channels	404
19.4.3	Coded orthogonal frequency division multiplexing	406
19.5	Channel estimation	407
19.5.1	Pilot-symbol-based methods	408
19.5.2	Methods based on scattered pilots	408
19.5.3	Methods based in eigendecompositions	410

19.6	Peak-to-average power ratio	411
19.6.1	Origin of the peak-to-average-ratio problem	411
19.6.2	Peak-to-average-ratio reduction techniques	412
19.7	Inter-carrier interference	414
19.8	Adaptive modulation and capacity	418
19.8.1	Channel quality estimation	418
19.8.2	Parameter adaptation	418
19.8.3	Signaling of chosen parameters	420
19.9	Multiple access	421
19.10	Multicarrier code division multiple access	421
19.11	Single-carrier modulation with frequency-domain equalization	423
	Further reading	424
20	Multiantenna systems	425
20.1	Smart antennas	425
20.1.1	What are smart antennas?	425
20.1.2	Purpose	426
20.1.3	Capacity increase	427
20.1.4	Receiver structures	429
20.1.5	Algorithms for adaptation of antenna weights	433
20.1.6	Uplink versus downlink	437
20.1.7	Network aspects	439
20.1.8	Multiuser diversity and random beamforming	440
20.2	Multiple-input multiple-output systems	442
20.2.1	Introduction	442
20.2.2	How does spatial multiplexing work?	442
20.2.3	System model	444
20.2.4	Channel-state information	444
20.2.5	Capacity in non-fading channels	445
20.2.6	Capacity in flat-fading channels	448
20.2.7	Impact of the channel	450
20.2.8	Layered space-time structure	456
20.2.9	Diversity	458
20.2.10	Tradeoffs between diversity, beamforming gain, and spatial multiplexing	462
	Further reading	462
PART V	STANDARDIZED WIRELESS SYSTEMS	465
21	GSM – Global System for Mobile communications	467
21.1	Historical overview	467
21.2	System overview	469
21.3	The air interface	470
21.4	Logical and physical channels	474
21.4.1	Logical channels	474
21.4.2	Mapping between logical and physical channels	476
21.5	Synchronization	479
21.5.1	Frequency synchronization	479
21.5.2	Time synchronization	480

21.5.3	Timing advance	480
21.5.4	Summary of burst structures	481
21.6	Coding	481
21.6.1	Voice encoding	481
21.6.2	Channel encoding	482
21.6.3	Cryptography	484
21.6.4	Frequency hopping	485
21.7	Equalizer	485
21.8	Circuit-switched data transmission	486
21.8.1	Transmission modes	488
21.8.2	Data transmission traffic channels	488
21.9	Establishing a connection and handover	489
21.9.1	Identity numbers	489
21.9.2	Identification of a mobile subscriber	490
21.9.3	Examples for establishment of a connection	491
21.9.4	Examples of different kinds of handovers	492
21.10	Services and billing	495
21.10.1	Available services	495
21.10.2	Billing	497
	<i>Appendix material: please see companion website (www.wiley.com/go/molisch)</i>	
21.A	Acronyms commonly used in the Global System for Mobile communications	
21.B	The original Global System for Mobile communications speech coder	
21.C	General Packet Radio Service	
	Further reading	498
22	IS-95 and CDMA 2000	499
22.1	Historical overview	499
22.2	System overview	499
22.3	Air interface	500
22.3.1	Frequency bands and duplexing	500
22.3.2	Spreading and modulation	500
22.3.3	Power control	501
22.3.4	Pilot signal	501
22.4	Coding	502
22.4.1	Speech coders	502
22.4.2	Error correction coding	502
22.5	Spreading and modulation	504
22.5.1	Long and short spreading codes and Walsh codes	504
22.5.2	Spreading and modulation in the uplink	505
22.5.3	Databurst randomization and gating for the uplink	505
22.5.4	Spreading and modulation in the downlink	507
22.5.5	Discussion	509
22.6	Logical and physical channels	509
22.6.1	Traffic channels	509
22.6.2	Access channel	509
22.6.3	Pilot channels	510
22.6.4	Synchronization channel	510
22.6.5	Paging channel	511

22.6.6	Power control subchannel	511
22.6.7	Mapping logical channels to physical channels	511
22.7	Handover	511
