General Introduction	1
Financial assets	1
Risks	2
Uncertainty and precaution	4
Problems: new methods and new instruments	7
Presentation of the book	8
PART I INDIVIDUAL vs COLLECTIVE CHOICE	11
Introduction to Part I	13
1 Risks in a Public Project: The Millau Viaduct	15
2 Individual Valuations and Economic Rationality	23
2.1 Preferences on consequences and utilities of decisions	24
2.2 Decisions, acts and contingent assets	25
2.2.1 Time contingent consumption	26
2.2.2 Games of chance	26
2.3 Criterion and individual valuation: averaging	28
2.4 A simple decision theoretic model	31
2.5 A general criterion of individual valuation	33
2.6 The two main criteria for decision-making in front of a known probability distribution: paradoxes and limitations	38
3 Aggregation of Individual Choices	43
3.1 Public choices	43
3.1.1 Comparability of individual utility functions	43
3.1.2 Arrow's impossibility theorem	45
3.1.3 Cost-benefit analysis	47
3.2 Market aggregation of individual preferences	49
3.2.1 The general equilibrium model under uncertainty	50
3.2.2 Reference to market prices in public capital budgeting	56

4 Individual and Collective Risk Management Instruments	63
4.1 Decision trees	63
4.1.1 Decision tree structure	63
4.1.2 Quantification of the decision tree	67
4.1.3 Decision trees in practice	69
4.2 Optimisation under constraints: mathematical programming	70
4.3 Risk and cost–benefit analysis	72
4.3.1 Valuation of non-traded commodities	73
4.3.2 Risk weighting	74
Concluding comments on Part I	79
PART II RISK vs UNCERTAINTY	83
Introduction to Part II	85
5 Insurable and Uninsurable Risks	89
5.1 Insurance of risks with a known probability distribution	90
5.2 Insurance of risks with uncertainties	93
5.3 Non-insurable risks	96
6 Risk Economics	97
6.1 Laws of large numbers and the principles of insurance	98
6.2 Risk aversion and applications to the demand for insurance	101
6.3 Background risk	107
6.4 Risk measures: variance and Value at Risk	109
6.5 Stochastic dominance	110
6.6 Aversion to risk increases	112
6.7 Asymmetric information: moral hazard and adverse selection	114
7 Marketed Risks	117
7.1 A general theory of risk measurement	117
7.1.1 Risk valuation	118
7.1.2 Equilibrium models of risk trades	123
7.2 Applications to risk valuation	125
7.2.1 Financial assets	125
7.2.2 Insurance	127
8 Management Instruments for Risk and for Uncertainty	131
8.1 Choosing optimal insurance	131
8.2 Insurance claims securitisation	134
8.2.1 Hedging catastrophe risks	134
8.2.2 Social risks	137
8.3 Valuing controversial risks	141
8.3.1 Reference to CAPM	144
8.3.2 Tracking error minimisation	145
8.3.3 Looking for a functional relationship	145
8.3.4 Looking for a comonotonic relationship	145
Concluding comments on Part II	147

PART III STATIC vs DYNAMIC	149
Introduction to Part III	151
9 Risk Businesses	153
9.1 Lotteries and the gambling business	153
9.2 Risks and investments	156
9.2.1 Financial market risks	156
9.2.2 Interest rate risk	157
9.2.3 Venture capital	159
9.2.4 Country risk	160
9.3 Credit risk	162
10 Valuation without Flexibilities	165
10.1 The net present value	165
10.2 Discounting	167
10.3 Static models of financial market equilibrium pricing	170
10.4 The value at risk	173
11 Valuation with Options	175
11.1 General theory of a dynamic measure of risks	175
11.1.1 Discrete time valuation	176
11.1.2 Valuation in continuous time	180
11.2 Applications to risk valuation	183
11.2.1 Financial risks	184
11.2.2 Investment projects	190
12 Static and Dynamic Risk Instruments	195
12.1 Static risk management instruments	195
12.2 Managing flexibilities	198
12.2.1 Managing credit risk	199
12.2.2 Construction of a hedging portfolio	202
Concluding comments on Part III	207
General Conclusion	211
1 How to deal with controversies	211
2 Look for market valuation	212
3 Measuring time	212
Traps	212
Research Paths	214
References	217
Index	221
