Preface	xiii
Acknowledgments	xvii
List of Acronyms	xix
Notes on Editors and Contributors	xxix
PART I INTRODUCTION	1
1 Modern Approaches to Radio Network Modelling and Planning	3
<i>Maciej J. Nawrocki, Mischa Dohler and A. Hamid Aghvami</i>	
1.1 Historical aspects of radio network planning	3
1.2 Importance and limitations of modelling approaches	5
1.3 Manual versus automated planning	7
References	9
2 Introduction to the UTRA FDD Radio Interface	11
<i>Peter Gould</i>	
2.1 Introduction to CDMA-based networks	11
2.2 The UTRA FDD air interface	15
2.2.1 Spreading codes	15
2.2.2 Common physical channels	20
2.2.3 Dedicated physical channels	27
2.3 UTRA FDD key mechanisms	29
2.3.1 Cell breathing and soft capacity	29
2.3.2 Interference and power control	31
2.3.3 Soft handover and compressed mode	32
2.4 Parameters that require planning	34
2.4.1 Signal path parameters	34
2.4.2 Power allocation	35
2.4.3 System settings	35
References	35

3 Spectrum and Service Aspects	37
<i>Maciej J. Grzybowski, Ziemowit Neyman and Marcin Ney</i>	
3.1 Spectrum aspects	37
3.1.1 Spectrum requirements for UMTS	38
3.1.2 Spectrum identified for UMTS	39
3.1.3 Frequency arrangements for the UMTS terrestrial component	39
3.1.4 Operator spectrum demands	45
3.2 Service features and characteristics	46
References	52
4 Trends for the Near Future	55
<i>Maciej J. Nawrocki, Mischa Dohler and A. Hamid Aghvami</i>	
4.1 Introduction	55
4.2 Systems yet to be deployed	56
4.2.1 UTRA TDD	56
4.2.2 TD-SCDMA	57
4.2.3 Satellite segment	58
4.3 Enhanced coverage	60
4.3.1 Ultra High Sites (UHS)	61
4.3.2 High Altitude Platform System (HAPS)	61
4.4 Enhanced capacity	61
4.4.1 Hierarchical Cell Structures (HCS)	61
4.4.2 High Speed Downlink Packet Access (HSDPA)	62
4.4.3 High Speed Uplink Packet Access (HSUPA)	63
4.4.4 Orthogonal Frequency Division Modulation (OFDM)	64
4.5 Heterogeneous approaches	64
4.5.1 Wireless LANs	64
4.5.2 Wireless MANs (WiMAX)	65
4.6 Concluding Remarks	65
References	65
PART II MODELLING	67
5 Propagation Modelling	69
<i>Kamil Staniec, Maciej J. Grzybowski and Karsten Erlebach</i>	
5.1 Radio channels in wideband CDMA systems	69
5.1.1 Electromagnetic wave propagation	69
5.1.2 Wideband radio channel characterisation	73
5.1.3 Introduction to deterministic methods in modelling WCDMA systems	75
5.1.4 Deterministic methods: comparison of performance	79
5.2 Application of empirical and deterministic models in picocell planning	80
5.2.1 Techniques for indoor modelling	80
5.2.2 Techniques for outdoor-to-indoor modelling	82
5.3 Application of empirical and deterministic models in microcell planning	84
5.3.1 COST 231 Walfisch–Ikegami model	85
5.3.2 Manhattan model	87
5.3.3 Other microcellular propagation models	88

5.4 Application of empirical and deterministic models in macrocell planning	90
5.4.1 <i>Modified Hata</i>	90
5.4.2 <i>Other models</i>	91
5.5 Propagation models of interfering signals	94
5.5.1 <i>ITU-R 1546 model</i>	94
5.5.2 <i>ITU-R 452 model</i>	100
5.5.3 <i>Statistics in the Modified Hata model</i>	104
5.6 Radio propagation model calibration	105
5.6.1 <i>Tuning algorithms</i>	106
5.6.2 <i>Single and multiple slope approaches</i>	108
Appendix: Calculation of inverse complementary cumulative normal distribution function	110
References	111
6 Theoretical Models for UMTS Radio Networks	115
<i>Hans-Florian Geerdes, Andreas Eisenblätter, Piotr M. Słobodzian, Mikio Iwamura, Mischa Dohler, Rafał Zdunek, Peter Gould and Maciej J. Nawrocki</i>	
6.1 Antenna modelling	115
6.1.1 <i>Mobile terminal antenna modelling</i>	117
6.1.2 <i>Base station antenna modelling</i>	118
6.2 Link level model	122
6.2.1 <i>Relation to other models</i>	123
6.2.2 <i>Link level simulation chain</i>	124
6.2.3 <i>Link level receiver components</i>	126
6.2.4 <i>Link level receiver detectors</i>	128
6.3 Capacity considerations	134
6.3.1 <i>Capacity of a single cell system</i>	134
6.3.2 <i>Downlink power-limited capacity</i>	134
6.3.3 <i>Uplink power-limited capacity</i>	137
6.4 Static system level model	139
6.4.1 <i>Link level aspects</i>	140
6.4.2 <i>Propagation data</i>	141
6.4.3 <i>Equipment modelling</i>	142
6.4.4 <i>Transmit powers and power control</i>	144
6.4.5 <i>Services and user-specific properties</i>	146
6.4.6 <i>Soft handover</i>	147
6.4.7 <i>Complete model</i>	148
6.4.8 <i>Applications of a static system-level network model</i>	149
6.4.9 <i>Power control at cell level</i>	152
6.4.10 <i>Equation system solving</i>	157
6.5 Dynamic system level model	161
6.5.1 <i>Similarities and differences between static and dynamic models</i>	161
6.5.2 <i>Generic system model</i>	162
6.5.3 <i>Input/output parameters</i>	164
6.5.4 <i>Mobility models</i>	164
6.5.5 <i>Traffic models</i>	165
6.5.6 <i>Path loss models</i>	167
6.5.7 <i>Shadowing models</i>	168

6.5.8 <i>Modelling of small scale fading</i>	169
6.5.9 <i>SIR calculation</i>	170
References	172
7 Business Modelling Goals and Methods	177
<i>Marcin Ney</i>	
7.1 Business modelling goals	177
7.1.1 <i>New business planning</i>	177
7.1.2 <i>Infrastructure development</i>	178
7.1.3 <i>Budgeting</i>	179
7.2 Business modelling methods	179
7.2.1 <i>Trends and statistical approach</i>	180
7.2.2 <i>Benchmarking and drivers</i>	181
7.2.3 <i>Detailed quantitative models</i>	181
7.2.4 <i>Other non-quantitative methods</i>	182
References	183
PART III PLANNING	185
8 Fundamentals of Business Planning for Mobile Networks	187
<i>Marcin Ney</i>	
8.1 Process description	187
8.1.1 <i>Market analysis and forecasting</i>	187
8.1.2 <i>Modelling the system</i>	189
8.1.3 <i>Financial issues</i>	190
8.1.4 <i>Recommendations</i>	190
8.2 Technical investment calculation	191
8.2.1 <i>CAPEX calculation methods</i>	191
8.2.2 <i>OPEX calculation methods</i>	196
8.2.3 <i>The role of drivers: Sanity checking</i>	197
8.3 Revenue and non-technical related investment calculation	198
8.3.1 <i>Input parameters and assumptions</i>	198
8.3.2 <i>Revenue calculation methods</i>	199
8.3.3 <i>Non-technical related investments</i>	199
8.4 Business planning results	199
8.4.1 <i>Business plan output parameters</i>	200
8.4.2 <i>Business plan assessment methods</i>	200
References	201
9 Fundamentals of Network Characteristics	203
<i>Maciej J. Nawrocki</i>	
9.1 Power characteristics estimation	203
9.1.1 <i>Distance to home base station dependency</i>	203
9.1.2 <i>Traffic load dependency</i>	207
9.2 Network capacity considerations	210
9.2.1 <i>Irregular base station distribution grid</i>	210
9.2.2 <i>Improper antenna azimuth arrangement</i>	212
9.3 Required minimum network size for calculations	214
References	218

10	Fundamentals of Practical Radio Access Network Design	219
	<i>Ziemowit Neyman and Mischa Dohler</i>	
10.1	Introduction	219
10.2	Input parameters	222
	10.2.1 Base station classification	222
	10.2.2 Hardware parameters	222
	10.2.3 Environmental specifics	229
	10.2.4 Technology essentials	231
10.3	Network dimensioning	238
	10.3.1 Coverage versus capacity	238
	10.3.2 Cell coverage	239
	10.3.3 Cell Erlang capacity	249
10.4	Detailed network planning	251
	10.4.1 Site-to-site distance and antenna height	252
	10.4.2 Site location	254
	10.4.3 Sectorisation	256
	10.4.4 Antenna and sector direction	259
	10.4.5 Electrical and mechanical tilt	260
	10.4.6 Temporal aspects in HCS	263
	References	268
11	Compatibility of UMTS Systems	271
	<i>Maciej J. Grzybowski</i>	
11.1	Scenarios of interference	272
	11.1.1 Interference between UMTS and other systems	272
	11.1.2 Intra-system interference	274
11.2	Approaches to compatibility calculations	275
	11.2.1 Principles of compatibility calculations	275
	11.2.2 Minimum Coupling Loss (MCL) method	280
	11.2.3 Monte Carlo (MC) method	283
	11.2.4 Propagation models for compatibility calculations	284
	11.2.5 Characteristics of UTRA stations for the compatibility calculations	286
11.3	Internal electromagnetic compatibility	286
11.4	External electromagnetic compatibility	292
	11.4.1 UMTS TDD versus DECT WLL	292
	11.4.2 Compatibility between UMTS and Radio Astronomy Service	294
	11.4.3 Compatibility between UMTS and MMDS	295
11.5	International cross-border coordination	296
	11.5.1 Principles of coordination	296
	11.5.2 Propagation models for coordination calculations	297
	11.5.3 Application of preferential frequencies	298
	11.5.4 Use of preferential codes	300
	11.5.5 Examples of coordination agreements	301
	References	305
12	Network Design – Specialised Aspects	309
	<i>Marcin Ney, Peter Gould and Karsten Erlebach</i>	
12.1	Network infrastructure sharing	309
	12.1.1 Network sharing methods	309

12.1.2	<i>Legal aspects</i>	313
12.1.3	<i>Drivers for sharing</i>	314
12.2	Adjacent channel interference control	315
12.3	Fundamentals of Ultra High Site deployment	318
	References	320
PART IV OPTIMISATION		321
13	Introduction to Optimisation of the UMTS Radio Network	323
	<i>Roni Abiri and Maciej J. Nawrocki</i>	
13.1	Automation of radio network optimisation	324
13.2	What should be optimised and why?	325
13.3	How do we benchmark the optimisation results?	326
13.3.1	<i>Location based information</i>	327
13.3.2	<i>Sectors and network statistical data</i>	328
13.3.3	<i>Cost and optimisation efforts</i>	330
	References	331
14	Theory of Automated Network Optimisation	333
	<i>Alexander Gerdenitsch, Andreas Eisenblätter, Hans-Florian Geerdes, Roni Abiri, Michael Livschitz, Ziemowit Neyman and Maciej J. Nawrocki</i>	
14.1	Introduction	333
14.1.1	<i>From practice to optimisation models</i>	334
14.1.2	<i>Optimisation techniques</i>	335
14.2	Optimisation parameters for static models	339
14.2.1	<i>Site location and configuration</i>	340
14.2.2	<i>Antenna related parameter</i>	340
14.2.3	<i>CPICH power</i>	344
14.3	Optimisation targets and objective function	345
14.3.1	<i>Coverage</i>	345
14.3.2	<i>Capacity</i>	346
14.3.3	<i>Soft handover areas and pilot pollution</i>	347
14.3.4	<i>Cost of implementation</i>	348
14.3.5	<i>Combination and further possibilities</i>	348
14.3.6	<i>Additional practical and technical constraints</i>	348
14.3.7	<i>Example of objective function properties</i>	349
14.4	Network optimisation with evolutionary algorithms	354
14.4.1	<i>Genetic algorithms</i>	355
14.4.2	<i>Evolution strategies</i>	357
14.4.3	<i>Practical implementation of GA for tilt and CPICH</i>	361
14.5	Optimisation without simulation	366
14.5.1	<i>Geometry-based configuration methods</i>	366
14.5.2	<i>Coverage-driven approaches</i>	368
14.5.3	<i>Advanced models</i>	369
14.5.4	<i>Expected coupling matrices</i>	372
14.6	Comparison and suitability of algorithms	373
14.6.1	<i>General strategies</i>	374
14.6.2	<i>Discussion of methods</i>	374
14.6.3	<i>Combination of methods</i>	375
	References	375

15 Automatic Network Design	379
<i>Roni Abiri, Ziemowit Neyman, Andreas Eisenblätter and Hans-Florian Geerdes</i>	
15.1 The key challenges in UMTS network optimisation	379
15.1.1 Problem definition	379
15.1.2 Matching UMTS coverage to GSM	380
15.1.3 Supporting high bit rate data services	381
15.1.4 Handling dual technology networks	382
15.2 Engineering case studies for network optimisation	382
15.2.1 Example network description	383
15.2.2 Pre-launched (unloaded) network optimisation	383
15.2.3 Loaded network optimisation	389
15.3 Case study: optimising base station location and parameters	395
15.3.1 Data setting	396
15.3.2 Optimisation approach	397
15.3.3 Results	399
15.3.4 Conclusions	402
References	403
16 Auto-tuning of RRM Parameters in UMTS Networks	405
<i>Zwi Altman, Hervé Dubreil, Ridha Nasri, Ouassim Ben Amor, Jean-Marc Picard, Vincent Diascorn and Maurice Clerc</i>	
16.1 Introduction	405
16.2 Radio resource management for controlling network quality	406
16.3 Auto-tuning of RRM parameters	408
16.3.1 Parameter selection for auto-tuning	408
16.3.2 Target selection for auto-tuning	410
16.3.3 Fuzzy logic controllers (FLC)	410
16.3.4 Case study: Auto-tuning of macrodiversity	412
16.4 Optimisation strategies of the auto-tuning process	415
16.4.1 Off-line optimisation using Particle Swarm approach	416
16.4.2 On-line optimisation using reinforcement learning	421
16.5 Conclusions	425
Acknowledgement	425

17 UTRAN Transmission Infrastructure Planning and Optimisation	427
<i>Karsten Erlebach, Zbigniew Jóskiewicz and Marcin Ney</i>	
17.1 Introduction	427
17.1.1 Short UTRAN overview	428
17.1.2 Requirements for UTRAN transmission infrastructure	428
17.2 Protocol solutions for UTRAN transmission infrastructure	430
17.2.1 Main considerations for ATM layer protocols in current 3G networks	430
17.2.2 MPLS-architecture for future 3G transmissions	443
17.2.3 The path to direct IP transmission networking	444
17.3 End-to-end transmission dimensioning approach	446
17.3.1 Dimensioning of Node B throughput	446
17.3.2 Traffic dimensioning of the ATM network	451
17.3.3 Traffic dimensioning of the IP-Network	452

17.4 Network solutions for UTRAN transmission infrastructure	456
17.4.1 <i>Leased lines</i>	456
17.4.2 <i>Point-to-point systems</i>	457
17.4.3 <i>Point-to-multipoint systems – LMDS</i>	460
17.4.4 <i>WiMAX as a potential UTRAN backhaul solution</i>	468
17.5 Efficient use of WiMAX in UTRAN	472
17.5.1 <i>Dimensioning of WiMAX for UTRAN infrastructure</i>	472
17.5.2 <i>Current WiMAX limitations</i>	473
17.6 Cost-effective radio solution for UTRAN infrastructure	474
17.6.1 <i>RF planning aspects</i>	474
17.6.2 <i>Throughput dimensioning</i>	475
17.6.3 <i>Methods of finding optimal LMDS network configurations</i>	476
17.6.4 <i>Costs evaluation of UTRAN infrastructure – software example</i>	485
17.6.5 <i>Example calculations and comparison of results</i>	487
