

CONTENTS

Preface	xi
Introduction	1
Goals of the Book	
Discrete Signals	
Advantages of Discrete-Signal Analysis and Design	
DFT and IDFT	
Mathcad Program	
MATLAB and Less Expensive Approaches	
Multisim Program from National Instruments Co.	
Mathtype Program	
LabVIEW	
Search Engines	
Personal Productivity Software Capability	
1 First Principles	9
Sequence Structure in the Time and Frequency Domains	
Two-Sided Time and Frequency	
Discrete Fourier Transform	
Inverse Discrete Fourier Transform	

Frequency and Time Scaling	
Number of Samples	
Complex Frequency-Domain Sequences	
$x(n)$ Versus Time and $X(k)$ Versus Frequency	
2 Sine, Cosine, and θ	27
One-Sided Sequences	
Combinations of Two-Sided Phasors	
Time and Spectrum Transformations	
Transforming Two-Sided Phasor Sequences into One-Sided Sine, Cosine, θ	
Example 2-1: Nonlinear Amplifier Distortion and Square Law Modulator	
Example 2-2: Analysis of the Ramp Function	
3 Spectral Leakage and Aliasing	43
Spectral Leakage. Noninteger Values of Time $x(n)$ and Frequency $X(k)$	
Example 3-1: Frequency Scaling to Reduce Leakage Aliasing in the Frequency Domain	
Example 3-2: Analysis of Frequency-Domain Aliasing Aliasing in the Time Domain	
4 Smoothing and Windowing	61
Smoothing the Rectangular Window, Without Noise and with Noise	
Smoothed Sequences Near the Beginning and End Rectangular Window	
Hamming Window	
Hanning (Hann) Window	
Relative Merits of the Three Windows	
Scaling the Windows	
5 Multiplication and Convolution	77
Sequence Multiplication	
Polynomial Multiplication	

Convolution
 Discrete Convolution Basic Equation
 Relating Convolution to Polynomial Multiplication
 “Fold and Slide” Concept
 Circular Discrete Convolution (Try to Avoid)
 Sequence Time and Phase Shift
 DFT and IDFT of Discrete Convolution
 Fig. 5-6. Compare Convolution and Multiplication
 Deconvolution

6 Probability and Correlation 95

Properties of a Discrete Sequence
 Expected Value of $x(n)$
 Include Some Additive Noise
 Envelope Detection of Noisy Sequence
 Average Power of Noiseless Sequence
 Power of Noisy Sequence
 Sequence Averaging
 Variance
 Gaussian (Normal) Distribution
 Cumulative Distribution
 Correlation and Covariance
 Autocorrelation
 Cross-Correlation
 Autocovariance
 Cross-Covariance
 Correlation Coefficient

7 The Power Spectrum 113

Finding the Power Spectrum
 Two-Sided Phasor Spectrum, One-Sided Power Spectrum
 Example 7-1: The Use of Eq. (7-2)
 Random Gaussian Noise Spectrum
 Measuring the Power Spectrum
 Spectrum Analyzer Example
 Wiener-Khintchine Theorem

System Power Transfer
Cross Power Spectrum
Example of Calculating Phase Noise

8 The Hilbert Transform 129

The Perfect Hilbert Transformer
Example of a Hilbert Transform of an Almost-Square Wave
Smoothing of the Example
Peaks in Hilbert of Square Wave
Mathematics of the Hilbert Transform
Analytic Signal
Example 8-2: Construction of Analytic Signal
Single-Sideband RF Signals
SSB Design
Basic All-Pass Network
–90° Cascaded Phase Shift Audio Network
Why the –90° Network Is Not Equivalent to a Hilbert
Transformer
Phasing Method SSB Transmitter
Filter Method SSB Transmitter
Phasing Method SSB Receiver
Filter Method SSB Receiver

**Appendix: Additional Discrete-Signal Analysis and Design
Information 153**

Discrete Derivative
State-Variable Solutions
Using the Discrete Derivative to Solve a Time Domain
Discrete Differential Equation

Glossary 163

Index 171
