

CONTENTS

FOREWORD TO THE SECOND EDITION	xiv
ACKNOWLEDGEMENTS	xvii
1 INTRODUCTION AND GENERAL CONSIDERATIONS	1
1.1 The CFD code	4
1.2 Porting research codes to an industrial context	5
1.3 Scope of the book	5
2 DATA STRUCTURES AND ALGORITHMS	7
2.1 Representation of a grid	7
2.2 Derived data structures for static data	9
2.2.1 Elements surrounding points – linked lists	9
2.2.2 Points surrounding points	10
2.2.3 Elements surrounding elements	12
2.2.4 Edges	14
2.2.5 External faces	14
2.2.6 Edges of an element	16
2.3 Derived data structures for dynamic data	17
2.3.1 N-trees	18
2.4 Sorting and searching	19
2.4.1 Heap lists	19
2.5 Proximity in space	22
2.5.1 Bins	22
2.5.2 Binary trees	26
2.5.3 Quadtrees and octrees	28
2.6 Nearest-neighbours and graphs	30
2.7 Distance to surface	30
3 GRID GENERATION	35
3.1 Description of the domain to be gridded	37
3.1.1 Analytical functions	37
3.1.2 Discrete data	37
3.2 Variation of element size and shape	38
3.2.1 Internal measures of grid quality	39
3.2.2 Analytical functions	39
3.2.3 Boxes	39

3.2.4	Point/line/surface sources	39
3.2.5	Background grids	42
3.2.6	Element size attached to CAD data	43
3.2.7	Adaptive background grids	43
3.2.8	Surface gridding with adaptive background grids	45
3.3	Element type	46
3.4	Automatic grid generation methods	47
3.5	Other grid generation methods	49
3.6	The advancing front technique	51
3.6.1	Checking the intersection of faces	52
3.6.2	Data structures to minimize search overheads	56
3.6.3	Additional techniques to increase speed	56
3.6.4	Additional techniques to enhance reliability	58
3.7	Delaunay triangulation	59
3.7.1	Circumsphere calculations	61
3.7.2	Data structures to minimize search overheads	62
3.7.3	Boundary recovery	63
3.7.4	Additional techniques to increase speed	63
3.7.5	Additional techniques to enhance reliability and quality	64
3.8	Grid improvement	65
3.8.1	Removal of bad elements	66
3.8.2	Laplacian smoothing	67
3.8.3	Grid optimization	67
3.8.4	Selective mesh movement	67
3.8.5	Diagonal swapping	68
3.9	Optimal space-filling tetrahedra	70
3.10	Grids with uniform cores	72
3.11	Volume-to-surface meshing	73
3.12	Navier–Stokes gridding techniques	75
3.12.1	Design criteria for RANS gridders	77
3.12.2	Smoothing of surface normals	79
3.12.3	Point distribution along normals	81
3.12.4	Subdivision of prisms into tetrahedra	81
3.12.5	Element removal criteria	83
3.13	Filling space with points/arbitrary objects	90
3.13.1	The advancing front space-filling algorithm	90
3.13.2	Point/object placement stencils	91
3.13.3	Boundary consistency checks	93
3.13.4	Maximum compaction techniques	93
3.13.5	Arbitrary objects	96
3.13.6	Deposition patterns	96
3.14	Applications	98
3.14.1	Space shuttle ascend configuration	99
3.14.2	Pilot ejecting from F18	100
3.14.3	Circle of Willis	103
3.14.4	Generic submarine body	105

3.14.5	Ahmed car body	105
3.14.6	Truck	105
3.14.7	Point cloud for F117	106
3.14.8	Hopper filled with beans/ellipsoids	107
3.14.9	Cube filled with spheres of different sizes	107
4	APPROXIMATION THEORY	109
4.1	The basic problem	109
4.1.1	Point fitting	110
4.1.2	Weighted residual methods	110
4.1.3	Least-squares formulation	112
4.2	Choice of trial functions	112
4.2.1	Constant trial functions in one dimension	112
4.2.2	Linear trial functions in one dimension	113
4.2.3	Quadratic trial functions in one dimension	114
4.2.4	Linear trial functions in two dimensions	115
4.2.5	Quadratic trial functions in two dimensions	117
4.3	General properties of shape functions	118
4.4	Weighted residual methods with local functions	118
4.5	Accuracy and effort	119
4.6	Grid estimates	121
5	APPROXIMATION OF OPERATORS	123
5.1	Taxonomy of methods	123
5.1.1	Finite difference methods	123
5.1.2	Finite volume methods	124
5.1.3	Galerkin finite element methods	124
5.1.4	Petrov–Galerkin finite element methods	124
5.1.5	Spectral element methods	124
5.2	The Poisson operator	124
5.2.1	Minimization problem	125
5.2.2	An example	126
5.2.3	Tutorial: code fragment for heat equation	128
5.3	Recovery of derivatives	130
5.3.1	First derivatives	131
5.3.2	Second derivatives	131
5.3.3	Higher derivatives	132
6	DISCRETIZATION IN TIME	133
6.1	Explicit schemes	133
6.2	Implicit schemes	135
6.2.1	Situations where implicit schemes pay off	136
6.3	A word of caution	136

7	SOLUTION OF LARGE SYSTEMS OF EQUATIONS	137
7.1	Direct solvers	137
7.1.1	Gaussian elimination	137
7.1.2	Crout elimination	139
7.1.3	Cholesky elimination	140
7.2	Iterative solvers	140
7.2.1	Matrix preconditioning	141
7.2.2	Globalization procedures	147
7.3	Multigrid methods	153
7.3.1	The multigrid concept	154
7.3.2	Injection and projection operators	155
7.3.3	Grid cycling	157
7.3.4	Algorithmic complexity and storage requirements	157
7.3.5	Smoothing	158
7.3.6	An example	159
8	SIMPLE EULER/NAVIER–STOKES SOLVERS	161
8.1	Galerkin approximation	162
8.1.1	Equivalency with FVM	164
8.2	Lax–Wendroff (Taylor–Galerkin)	164
8.2.1	Expediting the RHS evaluation	165
8.2.2	Linear elements (triangles, tetrahedra)	166
8.3	Solving for the consistent mass matrix	167
8.4	Artificial viscosities	167
8.5	Boundary conditions	169
8.6	Viscous fluxes	172
9	FLUX-CORRECTED TRANSPORT SCHEMES	175
9.1	Algorithmic implementation	176
9.1.1	The limiting procedure	176
9.2	Steepening	178
9.3	FCT for Taylor–Galerkin schemes	179
9.4	Iterative limiting	179
9.5	Limiting for systems of equations	180
9.5.1	Limiting any set of quantities	180
9.6	Examples	181
9.6.1	Shock tube	181
9.6.2	Shock diffraction over a wall	182
9.7	Summary	183
10	EDGE-BASED COMPRESSIBLE FLOW SOLVERS	187
10.1	The Laplacian operator	188
10.2	First derivatives: first form	190
10.3	First derivatives: second form	191
10.4	Edge-based schemes for advection-dominated PDEs	193
10.4.1	Exact Riemann solver (Godunov scheme)	194
10.4.2	Approximate Riemann solvers	195

10.4.3	Scalar limited dissipation	197
10.4.4	Scalar dissipation with pressure sensors	197
10.4.5	Scalar dissipation without gradients	198
10.4.6	Taylor–Galerkin schemes	199
10.4.7	Flux-corrected transport schemes	199
11	INCOMPRESSIBLE FLOW SOLVERS	201
11.1	The advection operator	201
11.1.1	Integration along characteristics	202
11.1.2	Taylor–Galerkin	202
11.1.3	Edge-based upwinding	203
11.2	The divergence operator	203
11.3	Artificial compressibility	206
11.4	Temporal discretization: projection schemes	206
11.5	Temporal discretization: implicit schemes	208
11.6	Temporal discretization of higher order	209
11.7	Acceleration to the steady state	210
11.7.1	Local timestepping	210
11.7.2	Reduced pressure iterations	210
11.7.3	Substepping for the advection terms	211
11.7.4	Implicit treatment of the advection terms	211
11.8	Projective prediction of pressure increments	212
11.9	Examples	213
11.9.1	von Karman vortex street	213
11.9.2	NACA0012 wing	216
11.9.3	LPD-17 topside flow study	218
11.9.4	DARPA SUBOFF model	223
11.9.5	Generic submarine forebody vortex flow study	225
12	MESH MOVEMENT	227
12.1	The ALE frame of reference	227
12.1.1	Boundary conditions	228
12.2	Geometric conservation law	228
12.3	Mesh movement algorithms	229
12.3.1	Smoothing of the velocity field	230
12.3.2	Smoothing of the coordinates	233
12.3.3	Prescription via analytic functions	235
12.4	Region of moving elements	235
12.5	PDE-based distance functions	236
12.5.1	Eikonal equation	237
12.5.2	Laplace equation	237
12.6	Penalization of deformed elements	238
12.7	Special movement techniques for RANS grids	239
12.8	Rotating parts/domains	240

12.9 Applications	241
12.9.1 Multiple spheres	241
12.9.2 Pilot ejection from F18	242
12.9.3 Drifting fleet of ships	242
13 INTERPOLATION	245
13.1 Basic interpolation algorithm	246
13.2 Fastest 1-time algorithm: brute force	247
13.3 Fastest N -time algorithm: octree search	247
13.4 Fastest known vicinity algorithm: neighbour-to-neighbour	249
13.5 Fastest grid-to-grid algorithm: advancing-front vicinity	250
13.5.1 Layering of brute-force searches	252
13.5.2 Inside-out interpolation	253
13.5.3 Measuring concavity	253
13.5.4 Vectorization	254
13.6 Conservative interpolation	257
13.6.1 Conservative and monotonic interpolation	259
13.7 Surface-grid-to-surface-grid interpolation	261
13.8 Particle-grid interpolation	265
14 ADAPTIVE MESH REFINEMENT	269
14.1 Optimal-mesh criteria	270
14.2 Error indicators/estimators	271
14.2.1 Error indicators commonly used	272
14.2.2 Problems with multiple scales	275
14.2.3 Determination of element size and shape	276
14.3 Refinement strategies	278
14.3.1 Mesh movement or repositioning (r-methods)	278
14.3.2 Mesh enrichment (h/p-methods)	278
14.3.3 Adaptive remeshing (M-methods)	284
14.3.4 Combinations	286
14.4 Tutorial: h-refinement with tetrahedra	286
14.4.1 Algorithmic implementation	287
14.5 Examples	291
14.5.1 Convection between concentric cylinders	291
14.5.2 Shock-object interaction in two dimensions	294
14.5.3 Shock-object interaction in three dimensions	296
14.5.4 Shock-structure interaction	297
14.5.5 Object falling into supersonic free stream two dimensions	297
15 EFFICIENT USE OF COMPUTER HARDWARE	299
15.1 Reduction of cache-misses	300
15.1.1 Array access in loops	300
15.1.2 Point renumbering	301
15.1.3 Reordering of nodes within elements	306
15.1.4 Renumbering of edges according to points	306

15.1.5	Some timings	308
15.1.6	Agglomeration techniques	309
15.2	Vector machines	316
15.2.1	Basic edge colouring algorithm	317
15.2.2	Backward/forward strategy	318
15.2.3	Combining vectorizability with data locality	318
15.2.4	Switching algorithm	319
15.2.5	Reduced i/a loops	321
15.2.6	Alternative RHS formation	326
15.3	Parallel machines: general considerations	328
15.4	Shared-memory parallel machines	329
15.4.1	Local agglomeration	330
15.4.2	Global agglomeration	331
15.4.3	Implementational issues	333
15.5	SIMD machines	334
15.6	MIMD machines	336
15.6.1	General considerations	337
15.6.2	Load balancing and domain splitting	337
15.6.3	Parallel flow solvers	342
15.7	The effect of Moore's law on parallel computing	344
15.7.1	The life cycle of scientific computing codes	346
15.7.2	Examples	348
15.7.3	The consequences of Moore's law	349
16	SPACE-MARCHING AND DEACTIVATION	351
16.1	Space-marching	351
16.1.1	Masking of points and edges	352
16.1.2	Renumbering of points and edges	354
16.1.3	Grouping to avoid memory contention	355
16.1.4	Extrapolation of the solution	356
16.1.5	Treatment of subsonic pockets	357
16.1.6	Measuring convergence	357
16.1.7	Application to transient problems	358
16.1.8	Macro-blocking	359
16.1.9	Examples for space-marching and blocking	360
16.2	Deactivation	365
16.2.1	Examples of dynamic deactivation	366
17	OVERLAPPING GRIDS	371
17.1	Interpolation criteria	372
17.2	External boundaries and domains	373
17.3	Interpolation: initialization	373
17.4	Treatment of domains that are partially outside	375
17.5	Removal of inactive regions	375
17.6	Incremental interpolation	377
17.7	Changes to the flow solver	377

17.8	Examples	378
17.8.1	Sphere in channel (compressible Euler)	378
17.8.2	Sphere in shear flow (incompressible Navier–Stokes)	378
17.8.3	Spinning missile	379
18	EMBEDDED AND IMMERSSED GRID TECHNIQUES	383
18.1	Kinetic treatment of embedded or immersed objects	385
18.1.1	Implementation details	388
18.2	Kinematic treatment of embedded surfaces	389
18.2.1	First-order treatment	389
18.2.2	Higher-order treatment	392
18.2.3	Determination of crossed edges	394
18.3	Deactivation of interior regions	395
18.4	Extrapolation of the solution	397
18.5	Adaptive mesh refinement	397
18.6	Load/flux transfer	398
18.7	Treatment of gaps or cracks	399
18.8	Direct link to particles	400
18.9	Examples	401
18.9.1	Sod shock tube	401
18.9.2	Shuttle ascend configuration	401
18.9.3	Blast interaction with a generic ship hull	402
18.9.4	Generic weapon fragmentation	404
18.9.5	Flow past a sphere	405
18.9.6	Dispersion in an inner city	411
18.9.7	Complex endovascular devices	411
18.9.8	Flow past a VW Golf 5	411
19	TREATMENT OF FREE SURFACES	419
19.1	Interface fitting methods	419
19.1.1	Free surface discretization	421
19.1.2	Overall scheme	422
19.1.3	Mesh update	422
19.1.4	Examples for surface fitting	424
19.1.5	Practical limitations of free surface fitting	427
19.2	Interface capturing methods	429
19.2.1	Extrapolation of the pressure	432
19.2.2	Extrapolation of the velocity	432
19.2.3	Keeping interfaces sharp	432
19.2.4	Imposition of constant mass	433
19.2.5	Deactivation of air region	433
19.2.6	Treatment of bubbles	434
19.2.7	Adaptive refinement	435
19.2.8	Examples for surface capturing	435
19.2.9	Practical limitations of free surface capturing	448

20 OPTIMAL SHAPE AND PROCESS DESIGN	449
20.1 The general optimization problem	449
20.2 Optimization techniques	451
20.2.1 Recursive exhaustive parameter scoping	452
20.2.2 Genetic algorithms	453
20.2.3 Gradient-based algorithms	458
20.3 Adjoint solvers	462
20.3.1 Adjoint equations: residuals with first derivatives and source terms	463
20.3.2 Adjoint equations: residuals with second derivatives	464
20.3.3 Jacobians for Euler/Navier–Stokes equations	465
20.3.4 Adjoint solvers	467
20.3.5 Gradient evaluation	468
20.4 Geometric constraints	469
20.4.1 Volume constraint via cost function	469
20.4.2 Volume constraint via gradient projection	470
20.4.3 Volume constraint via post-processing	471
20.5 Approximate gradients	471
20.6 Multipoint optimization	471
20.7 Representation of surface changes	472
20.8 Hierarchical design procedures	472
20.9 Topological optimization via porosities	473
20.10 Examples	474
20.10.1 Damage assessment for contaminant release	474
20.10.2 External nozzle	475
20.10.3 Wigley hull	477
20.10.4 KRISO container ship (KCS)	480
References	481
Index	515
