SUBJECT INDEX

A

Accuracy of sample design, 134
ADA (Americans with Disabilities Act), 271
Addition (carryover) effect, 304
Administration/monitoring: of attitude questions, 282–283; choosing the most appropriate method of, 241; comparing personal/telephone interviews, self-administered questionnaire, 117–118; of computer-assisted data collection systems, 333–334; considerations for special populations, 335–336; examples of, 337; field procedures, 312–320; guidelines for minimizing errors/maximizing survey quality in, 337–338; hiring and training interviewers, 320–327; of knowledge questions, 273; managing surveys, 329–333; questionnaire design and, 217; scale construction and issues of, 76; special considerations for Internet surveys, 334–335; supervising fieldwork, 327–328; of threatening questions, 264–265
Advance notice procedures, 312–314
African Americans: health survey questions on race of, 249–251; weighting sample adjusting for nonresponse/noncoverage of, 189–190. See also Minorities
Agency for Healthcare Research and Quality, 24, 222, 223, 259, 284, 286
Age/sex questions, 248–249, 299
AGGIES software, 333
Aided recall techniques, 258–259
AIDS. See HIV/AIDS
AI-SUPERPFP Team, 326
Alameda County Study, 33
Alpha reliability coefficient, 60
Alternative or Ha research hypothesis, 164–167, 165f
Alternative modes of administration, 76
American Hospital Association, 354
American Medical Association, 354
American Psychiatric Association, 66
American Psychological Association, 54, 62
American Statistical Association, 10, 22, 177
Analysis plan: errors related to, 400t, 404; mapping out the, 383–384t, 385–387; written report on, 396, 400t, 404
Analytical designs: comparing descriptive and, 356–37; comparisons/relationships in, 375–376; computing sample size for experimental and, 164–174; criteria for estimating sample size for, 158; described, 30; focus on empirically observed relationships, 42; objectives and hypotheses for, 39f. See also Experimental designs; Survey design
Anchoring, 303
Anonymity issues, 6, 264
ANOVA (analysis of variance) procedures, 59, 166, 382
Area probability sample, 136–138, 139
The Art of Asking Questions (Payne), 197
Asian American tobacco use, 270
Asking Questions (Bradburn et al.), 247
B
Balanced repeated replication, 177
Baltimore Needle Exchange Program, 342
Behavior coding, 206
Behavioral Model of Health Services Utilization and Access, 98
Behavioral Risk Factor Surveillance Team, 10
BELLCORE data files (Bell Communications Research), 139, 140
Bias: data preparation to minimize, 358; interviewers and potential for, 336; noncoverage and nonresponse, 112–113, 188–190, 193; sampling/selection, 108–109, 112–113, 192–193, 225, 335
Bivariate statistics, 367, 373–375fig, 376–379, 378fig
Blaise software, 333
Bounded recall procedures, 257–258
British birth cohort study (1946), 33
Budget. See Cost issues
Bureau of Labor Statistics, 203, 250, 252
C
CADAC (computer-assisted data collection). See Computer-assisted data collection (CADAC)
CADE software, 348
CAPI (computer-assisted personal interviewing), 103, 105, 106, 118, 289
CASES software, 333
CASI (computer-assisted self-interviewing), 103–105, 106, 289, 347
CASM (Cognitive Aspects of Survey Methodology), 200–201
Category scaling approach, 230
CATI (computer-assisted telephone interviewing), 102, 105, 106, 118, 248, 289, 316, 347
Centers for Disease Control and Prevention, 270, 334
Centers for Medicare and Medicaid Services, 32, 33
Central tendency measures, 370, 371–372
CHIS (California Health Interview Survey): advance notice procedure used in, 313; age/sex questions in, 248–249; aided recall techniques used in, 258; behavior questions in, 254, 255, 263; coding data in, 343; data analysis procedures used in, 388; data preparation procedures in, 357; demographic questions asked in, 247, 266; described, 18, 43; on education level, 251; employment status question in, 252; ethnicity/race question in, 250–251; field procedure documentation used in, 320, 337; household composition question in, 248; hypothesis testing in, 98; income question in, 253; instructions used in, 263; interviewer training during, 324, 337; marital status question in, 249; measurements used in, 243; number of items used in, 239, 240; objectives, design, questions of, 44; occupation question in, 252–253; open-ended questions used in, 262; order of questions in, 305; proxy respondents used in, 319; questionnaire design used in, 219; questionnaire formatting used in, 309; range checking in, 349; sampling used in, 151–152, 191; schedule of contact used in, 316; telephone interviews used in, 121
Chi-square statistics, 366, 374, 379, 383
Chunk sample, 128
Civil Rights Act (1964), 249
Classical measurement theory, 75–76
Clinometric norms, 224–225
Closed-end questions: coding, 343; not recommended for behavior questions, 262; responses to, 216
Cluster sample, 133–134, 135, 136
CMT (classical measurement theory), 74
Cochran Q-test, 374
Codebooks, 344
Coding data, 341–345
Data preparation, continued
350–354; TDM (tailored design method) approach to, 303;
testing procedures for, 209–210; written report discussion on,
396, 400, 403. See also Computer-assisted data
collection (CADAC)
Deductive imputation, 351
DEFF (design effect), 175–176. See also Design effects
Demographic questions: on age and sex, 248–249; on education,
251–252; on employment status, 252; guidelines for minimizing
errors in, 266–267; on household composition,
247–248; on income, 253–254; on marital status, 249; on
occupation, 252–253; overview of, 246–247; on race/ethnicity,
249–251, 265–266
Dependent variables: definition of, 41; relationships among, 81–99
Descriptive designs: comparing analytical and, 35–37;
computing sample size for, 156–163, 160; cross-sectional,
30, 31–32, 39/fg, 159–160; 161, 162; group-comparison, 30, 32,
158, 160, 162–163.
Descriptive statistics, 366–367
Design. See Questionnaire design; Sample designs
Design effects: comparing telephone interviews, personal
interviews, and self-administered questionnaires, 113–114; computed for the
sample size, 175–178; definition of, 113; errors associated with,
103t; sample size adjusted for estimated sample, 178t, 180
Diagnostic and Statistical Manual of Mental Disorders (DSM-IV-TR), 66
Diagnostic Interview Schedule (DSM-IV-TR), 66
Diaries (memory aid), 259–260
DIF (differential item functioning), 75
Dispersion measures, 372–373
Disproportionate sampling, 149, 186t
“Do not call” telephone blocks, 111–112
Documentation: of field procedures, 320, 337; research report, 392–404, 393t,
398t–400t
Donnelley Marketing Information Services, 139
Dual-frame sampling, 150
Dummy variables, 355–356
E
Economic norms, 244
Edge coding, 346
Education level question, 251–252
Effect modification (or interaction) hypothesis testing, 91–92, 93/fg
Employment status question, 252
Environment (health survey topic), 12, 14
EpiData, 334
Epidemiology: definition of, 28; health surveys’ application to,
222–223
EpiInfo, 177, 334, 348
EQ-5D (EuroQol Instrument), 226
Errors. See Survey errors
Ethical issues: anonymity and confidentiality, 6; benefit versus harm, 5–6; importance
of considering, 4–5; informed consent as, 5
Ethnicity/race issues: questions relating to, 249–251, 265–266;
related to hiring interviewers, 321
Ethnographic interviewing, 204
Evenhandedness norm, 303
Existence of a relationship, 367–368
Experimental designs: computing sample size for analytical and,
164–174; criteria for estimating sample size for, 158t; described,
29t, 30, 33–34; objectives and hypothesis for, 39/fg, 42; random
assignments as part of, 33–34;
relating health questions to,
237–238. See also Analytical
designs; Study designs
Explanatory hypothesis testing model, 87–88/fg, 89
External validity: definition of, 43–44; study design and, 43, 45, 46
Extraneous (or confounding) variable, 98
F
Face-to-face surveys. See Personal interviews
Field editing questionnaires, 327
Field procedures: advance notice, 312–314; documentation of,
320; follow-up contacts, 315–317; hiring and training interviewers, 320–327;
icincentives for respondents, 317–318; proxy respondents, 318–320; schedule for contacts,
314–315
Field size column, 344
Field-coded open-ended questions, 276
Financial issues. See Cost issues
Focus groups, 203–204
Forced-choice format, 299–300
Framingham Study, 33
Frequencies, 369, 370t, 371
F-test, 167, 366
G
GENESYS, 140
GIS (geographic information systems), 28
Group Health Association of America Consumer Satisfaction Survey, 286
Group interviews, 203–204
Group-comparison designs: criteria for estimating sample size for,
158; described, 30, 32; estimating sample size for, 160t,
162–163, 167–168, 170, 173; objectives and hypotheses for,
39/fg; primary comparisons built

Subject Index
into, 373; relating health questions to, 236–237

### H

**Ha** (alternative or research hypothesis): assumptions underlying, 164; Type I and Type II errors of sample size and, 164–167, 165

**Hagan and Collier method of respondent selection**, 145, 146

**Handbook of Survey Research** (Weinberg), 324

**Handheld Assisted Personal Interview software**, 334

**Health**: generic versus disease-specific concepts of, 235; multidimensional concept of, 232–233; positive versus negative concepts of, 233–234; provider versus patient concepts of, 234–235; WHO definition of, 15, 232. See also Health status

**Health care expenditures topic**, 16–17

**Health care services topic**, 16

**Health care system topic**, 14–15

**Health Insurance Portability and Accountability Act (HIPAA)**, 5, 6, 312

**Health measures**: considerations for special populations, 242–243; criteria for developing/evaluating, 223–225; evaluating reliability of, 240; evaluating validity of, 240–241; examples of, 243; HRQOL (health-related quality of life), 226, 230–231, 235; matching scales to, 238–240; minimizing errors/maximizing survey quality guidelines for, 243–244; steps in developing/evaluating, 232–242; tailored to study sample, 241–242; types of general, 228; utility-related scaling methods for, 225–227/fig, 230–232; WHO development of functioning health, 235

**Health Plan Employer Data and Information System**, 222

**Health questions**: considerations for special populations, 242–243; criteria for developing, 223–225; deciding how to best phrase, 242; examples of, 243; general health status measures applied to, 228/fig, issues regarding formulation of, 221–223; minimizing errors/maximizing survey quality in formulating, 243–244; steps in developing, 232–242; utility-related scaling methods applied to, 225–227/fig, 230–232

**Health status**: criteria for developing/evaluating measures of, 223–225; development steps/issues of measuring, 242–244; economic norms and preferences and, 224; as health survey topic, 15–16; selected types of general measures of, 228; utility-related scaling methods for measuring, 225–227/fig, 230–232. See also Health

**Health surveys**: criteria for developing/evaluating measures of, 223–225; five major applications of, 222–223. See also Specific health surveys

**Hierarchical hot-deck imputation**, 352–353

**Hierarchical linear models**, 192

**HIPAA (Health Insurance Portability and Accountability Act)** (1996), 5, 6, 312

**Hispanics**: health survey questions on ethnicity of, 249–251; weighting sample adjusting for nonresponse/noncoverage of, 189–190; “yea-saying” tendency observed among, 283. See also Minorities

**HIV/AIDS**: increasing focus of health surveys on, 265; KAB (knowledge, attitude, and behavior) surveys on topic of, 269–270; knowledge questions on, 271, 272; ordinal procedures for data analysis of, 376–377; phrases used in threatening questions about, 262; WHOQOL-HIV instrument used for, 235; “yea-saying” response to questions on, 277–278

**Ho** (null hypothesis): assumptions underlying, 164; Type I and Type II errors of sample size and, 164–167, 165

**Hot-deck imputation**, 352–353

**HRQOL (health-related quality of life) construct**: described, 226; reliability of, 231; three utility-related measures of, 230–231; WHOQOL-HIV instrument and, 235

**HUI** (Health Utilities Index), 226

**Hypotheses.** See Study hypotheses

### I

**Improving Interview Method and Questionnaire Design** (Sudman & Bradburn), 198–199

**Incentives for respondents**, 317–318

**Income question**, 253–254

**Independent variables**: definition of, 41; relationships among, 81–99

**Indexes**: constructing, 69–70/fig, 283

**Knowledge of HIV/AIDS Index** (UNICEF survey), 77–78

**Inferential statistics**, 366–367

**Informed consent**, ethical considerations of, 5

**Institute of Medicine**, 242

**Instructions**: questionnaire, 216–217; TDM (tailored design method) approach to, 298–309; transition sentences used in, 263

**Interaction (or effect modification)** hypothesis testing, 91–92, 93/fig

**Internal consistency reliability**, 55, 60–62

**Internal validity**: definition of, 43; study design and, 43, 45–46
International Quality of Life Assessment Project, 222
Internet surveys: administration considerations for implementing, 334–335; Dillman’s principles in designing, 307–308; firewall protection barrier to, 111–112; formatting considerations for, 307–308; sample design used in, 141; samples used in, 105, 107–114. See also Computer-assisted data collection (CADAC)
Interpretability, 76
Interpretation hypothesis testing model, 89–90
Inter-rater reliability, 55, 59–60
Inter-University Consortium for Political and Social Research (University of Michigan), 10
Interval (or ratio) variables, 53–54, 377–378
Interviewers: field coding by, 343–344; hiring, 320–323; observing, 328; potential for bias of, 336; supervising, 327–328; training, 323–327. See also Personal interviews
Interviews: bounded recall procedures during, 257–258; cognitive and think-aloud strategies during, 255–257; ethnographic, 204; focus groups or group, 203–204; “focused” or “conversational” types of, 326; managing survey, 329–333; validating completed, 327–328. See also Personal interviews; Respondents; Telephone interviews
IRT (item response theory), 73, 74–76
Items: attitude and knowledge questions, 284; CHIS (California Health Interview Survey), 239, 240; DIF (differential item functioning), 75; IRT (item response theory) used to quantify, 74; NCHS-NHIS (National Health Interview Survey) multiple, 239; providing clear instructions for open-ended, 298; psychometric criteria for health, 224; question order and increased positiveness of summary, 304; TDM (tailored design method) approach to instructions for open-ended, 298. See also Questions

J
Jackknife repeated replication, 177

K
KAB (knowledge, attitude, and behavior) surveys, 270–271
Katz’s Index of Independence in Activities of Daily Living, 236
Kendall coefficient of concordance, 379, 382
Kish tables approach to sampling, 142/fig. 144
Knowledge, attitude, and behavior (KAB) surveys, 270–271
Knowledge of HIV/AIDS Index (UNICEF survey), 77–78
Kruskal-Wallis test, 382
Kuder-Richardson formula, 61

L
Last or next birthday method of respondent selection, 145–146
Likert summative scale: CMT (classical measurement theory) to construct, 74; constructing, 70, 71/t. 72–73
Linguistic analysis of questionnaires, 205, 206
LISREL (LInear Structural RELations), 383
List sample, 140–141
List-assisted frames sampling method, 139
Literature review, 395
Log-linear analysis, 379
Longitudinal designs: comparisons/relationships in, 375; criteria for estimating sample size for, 158; described, 30, 32–33; objectives and hypotheses for, 39/fig. relating health questions to, 237

M
Mail and Internet Surveys: The Tailored Design Method (Dillman), 314
Mail surveys: advance notice procedures used in, 313–314; bias in self-administered, 108–109; follow-up contacts, 316–317; proxy respondents used in, 319–320; sample budget for personal, telephone, and, 331–333/t. schedule for contacts, 315; TDM (tailored design method) approach to, 295–303
Managing surveys: budget issues, 329–330; sample survey time line, 330; schedule, 329. See also Administration/monitoring
Mantel-Haenszel procedure for data analysis, 379
Marital status question, 249
Marlowe-Crowne Social Desirability Scale, 278
Master Settlement Agreement (MSA), 271
McNemar test, 374
MCOs (managed care organizations), Medical Outcomes Study examination of, 50.
Mean, 372
Subject Index

Measurement matrix: constructing a, 361, 365; National Dental Malpractice Survey (NDMS), 362–364
Measurements: applying different levels of, to define variables, 51–54; attitude strength, 278–282; developing health, 223–244; errors related to, 399; 403; interval or ratio variables, 53–54; nominal variables, 51–52; 53; ordinal variables, 52; 53; written report discussion on, 396, 399; 403. See also Data analysis; Scales; Statistics
Measures of central tendency, 370–372
Measures of dispersion, 372–373
Median, 371–372
Median test, 382
Medical Care Satisfaction Questionnaire, 284
Medical Outcomes Study. See MOS (Medical Outcomes Study)
Medical Research Council National Survey of Health Development (UK), 33
Medicare Current Beneficiary Survey, 32–33
Memory (respondent): impact on reporting of events, 255–257; procedures for aiding, 258–260
MEPS (Medical Expenditure Panel Survey), 257–258, 259
Methods description, 395
MICS. See UNICEF Multiple Indicator Cluster Survey (MICS)
Minorities: race/ethnicity questions and, 249–251, 265–266; responses to minority interviewers by, 321. See also Special populations; Subgroup samples
Mixed parametric statistics, 378/fig–379, 382–383
Mobile population samplings, 150–151
Mock tables, 92, 95e–97, 387
Mode (or modal) response, 371
Monitoring. See Administration/monitoring
MOS (Medical Outcomes Study): concurrent validity analyses conducted in, 68–69; construct validity of, 66, 67; described, 50, 67, 222; general health status measures used in, 236–237; ordinal variables used in, 53; scales used in, 62, 73, 76–77; SF-8 form of, 225; SF-12 form of, 76–78, 225; SF-36 form to test reliability of, 57, 61, 73, 75, 76–77, 225, 232
MSA (Master Settlement Agreement), 271
Multiple frame sampling method, 139
Multiple imputation, 353–354
Multivariate statistics, 367, 379, 380/fig–381/fig, 382
N
National Academy of Sciences, 199, 200
National Ambulatory Medical Care Survey, 260
National Center for Chronic Disease Prevention and Health Promotion, 270
National Center for Health Services Research, 326
National Center for Health Statistics (NCHS), 3, 5, 24, 32, 107, 201, 203, 204, 257, 259, 313
National Dental Malpractice Survey. See NDMS (National Dental Malpractice Survey)
National Health Interview Survey, 32, 107, 239, 253
National Medical Care Expenditure Survey (NMCES), 257, 259
National Partnership for Reinventing Government, 210
National Quality Measures Clearinghouse Web site, 286
National Research Council, 200
NCHS Cognitive Methods Working Paper Series, 205
NCHS National Hospital Discharge Survey, 334
NCHS National Mortality Followback Surveys, 334
NCHS Questionnaire Design Research Laboratory (QDRL), 205
NCHS Vital and Health Statistics Series No. 6, 205
NCHS–Health and Nutrition Examination Survey, 234
NCHS–NHIS (National Health Interview Survey): advance notice procedures used in, 213; bounded recall procedures used in, 258; cognitive techniques used in, 205; family income question in, 253–254; as KAB (knowledge, attitude, and behavior) study, 270; multiple-item approach used in, 239; provider perspectives asked in, 234
NCQA (National Committee for Quality Assurance), 222
NDMS (National Dental Malpractice Survey): appearance of, 302; attitude questions in, 278–279; column response format used in, 300; demographic questions in, 266; described, 18, 43; first question asked in, 304; health measures used in, 243; hypothesis testing in, 98; instructions used in, 298, 299; Likert summary scale used in, 73; mail survey design used in, 122; measurement matrix constructed for, 362–364; objectives, design, and research questions of, 44; questionnaire design used in, 219; sampling approaches used in, 152, 1 91–192; schedule of contact used in, 317; TDM (tailored design method) guidelines used in, 295
Network sampling, 149–150
NMES (National Medical Care Expenditure Survey), 257, 259
Nominal variables, 51–52; 53, 374–375/fig, 376
Noncoverage bias, 112–113, 188–190, 193
Nonparametric statistics: described, 367; nominal, 374–375/fig, 376; ordinal, 375/fig, 376–377
Nonresponse: to attitude questions, 280–281; bias due to, 112–113, 193; weighting the sample to adjust for, 188–190
Norm of evenhandedness, 303
Normal sampling distribution, 156
NORSTAT software, 333
Null (Ho) hypothesis, 164–167, 165
Numerical codes: for closed-end responses, 296; consistency in, 296–297
Objectives. See Study objectives
Observation, 7–8
Observational design: cross-sectional, 30, 31–32; described, 294–31; group comparison, 30, 32; longitudinal, 30, 32–33
Occupation questions, 252–253, 299
Office of Management and Budget (OMB), 210, 246, 250, 318
Office of the Surgeon General, 233
One-tailed hypothesis, 166
Open-ended questions: coding data from, 342–343; field-coded, 276; recommended for behavior questions, 262; responses to, 216
OR (odds ratio), 85
Order of questions, 303–306
Ordinal variables, 52, 53, 375
Ordinal variables, 52t, 53, 375fg, 376–377
Panel on Survey Measurement of Subjective Phenomena, 199
Panel studies, 32–33
Paperwork Reduction Act (1995), 318
PAR (participatory action research), 204–205
Parametric statistics, 367, 377–379, 378fg, 382–383
Participants. See Respondents
Patient satisfaction: attitude and knowledge questions on, 283–285, 286; as health survey topic, 17
Patient Satisfaction Questionnaire, 284
PC-CARP, 177
PDAs (portable digital assistants), 103–104
Pearson chi-square, 374, 379
Pearson correlation coefficient, 377
Personal interviews: advance notice, 313; carrying out the survey, 117–118; comparing telephone interviews, self-administered questionnaires and, 105, 107–121; comparison of paper-and-pencil and computer-assisted, 106; costs of, 120; drawing the sample for, 105, 107–114; follow-up contacts, 315–316; formatting the questionnaire for, 117; formulating the questions for, 114–117; preparing data from, for analysis, 118–120; proxy respondents used in, 318–319; sample budget for telephone, mail, and, 331–333; schedule for contacts, 314–315; validating completed, 327–328.
Phrases: in attitude questions, 274–275; as questions, 213–214, 242; TDM (tailored design method) approach to, 299; in threatening questions, 261–262. See also Interviews; Interviews

Respondent and administrative burden, 76

Response effect research, 197–200

Response Effects in Surveys (Sudman & Bradburn), 198

Response rates (RR): data collection methods and, 109–112; definition of, 109; sample size and calculation of, 181–183; 184–185; sample size computation adjusted for expected, 178, 180–181; weighting adjustment, 189

Responses: aligning codes or boxes for, 297–298; to attitude questions, 276–282; bounded recall procedures and, 257–258; to closed-end questions, 216; coding the, 341–345; column format for series with same categories for, 300–301; context effects of, 217; false-positive or false-negative, 199–200; forced-choice format for, 299–300; impact of memory and
Sample bias: Internet surveys and, 335; minimizing error in respondent, 192–193; noncoverage and nonresponse, 112–113

Sample designs: area probability, 136–139, 151; comparing probability and nonprobability, 127–129; criteria to evaluate different, 134–136; errors related to, 398t, 401–402; Internet, 141; list, 140–141; random digit dialing, 139–140; relating research question to, 125–129; types of probability, 129–134, 148/fg; written report discussion on, 395, 398t, 401–402

Sample probability designs: cluster sample, 133–134, 135t, 136; evaluating different, 134–136, 135t; listed, 129; overview of, 127–129; for sampling rare populations, 148/fg; simple random sample, 129–131, 130/fg, 135t; stratified sample, 131–133, 132/fg, 135t–136; systematic random sample, 131, 135t

Sample size: additional adjustments in computing, 178t–181; calculation of response rate and, 181–185; computing for analytical and experimental studies, 164–174; computing for descriptive studies, 156–163; computing design effect for the, 175–178; computing response rate, 181–183t, 184–185; considerations for special populations, 190; criteria for estimating, based on study design, 158t; examples of, 191–192; minimizing errors/maximizing survey quality guidelines for, 192–193t; normal sampling distribution and, 156/fg–158; power chart for two-tailed hypotheses, 172; PPS (probability proportionate to size), 136–138t, 139, 151, 191; related to study objectives and design, 155; resources for power analysis of, 171/fg; statistical software package for estimating, 155, 177; weighting to adjust for nonresponse/noncoverage, 188–190; weighting to reflect the population, 185–188

Sample size (analytical/experimental studies): addressing all of the study objectives, 174; analytical, using multivariate analyses, 173–174; case-control (two groups), 169t, 171; group-comparison (two groups), 167–168t, 170, 173; overview of, 164–167, 165t

Sample size (descriptive studies): for cross-sectional (one group) design, estimating mean, 160t, 162; for cross-sectional (one group) design, estimating proportion, 159–160t, 161t; for group-comparison (two groups) design, estimating mean, 160t, 163; for group-comparison design (two groups), estimating proportion, 160t, 162–163; overview of, 156/fg–159

Sample size computation adjustments: 1: adjust for size of population, 178t, 179–180; 2: adjust for estimated sample design effect, 178t, 180; 3: adjust for expected response rate, 178t, 180–181; 4: adjust for expected proportion of eligibles, 178t, 181; 5: compute survey costs, 178t, 181; formulas listed, 178t

Samples/sampling: accuracy in selecting respondents, 113; comparison of, in personal interviews, telephone interviews, and self-administered questionnaires, 105–106t, 107–121; considerations for special populations, 146–151; coverage of the population, 107–109; design effects, 113–114; disproportionate, 149, 186t; examples of, 151–152; Internet surveys, 102, 103–105, 107–114, 141; minimizing errors/maximizing survey quality guidelines for, 152–153t; response rates from, 109–112; tailoring health measures to, 241–242; testing survey, 208–209; univariate statistics to describe, 369–370t, 371–373; weighting to adjust for nonresponse/noncoverage, 188–190; weighting to reflect population, 185–188. See also Respondent selection

Sampling element, 127
Sampling frame, 126–127
SAS software, 177, 187
SBCM (strengths-based case management) model, 342–343
Scales: constructing, 70–71t, 72–76; IRT (item response theory) for constructing, 73, 74–76; Likert summative, 70, 71t, 72–73, 74; matching health measures to, 238–240; measuring attitude.
strength, 278–282; measuring health using utility-related, 225–227; 230–232; used in MOS (Medical Outcomes Study), 62; using single-item versus multi-item, 239–240; utility-scaling approach to, 73–74. See also Measurements
