a
absolute values 26
acceleration vector function
rigid body in curvilinear motion 99, 105, 106, 109–110, 112, 113
rigid body in rectilinear motion 96, 97
agriculture, statistics used in 426
air temperature, averages 53–54
aircraft
  crack detection in 4–5
  design analysis 18–19
airport baggage conveyor [example] 111–114
algebraic equations 24–25
  examples of use 13, 16, 24–25
  see also linear algebra; matrix algebra; vector algebra
algorithms 120
American Academy of Engineering, list of engineering achievements 2
American Society of Mechanical Engineers (ASME), pressure vessel design code 18, 382
ANSYS [finite-element analysis] code 382, 417
  element library 386, 404, 418, 419
  product-development simulation 420–422
automatic motion control of machines, mathematical modeling of 172
automobile braking system, new design, simulation by ANSYS code 421, 422
Avallone, E.A. 3, 10, 11, 12, 15, 16, 24, 218, 427, 445
axis of rotation [in solids of rotation] 42
b
“back substitution” [in Gaussian elimination method] 135
  recurrence relationships for 137, 140–141
bar elements [in FEA] 384, 385
  interpolation functions for 388, 391–392
beam bending
  in bridge design analysis 15–16
  in coat hanger design analysis 11, 12–13
differential equation for 186
  Laplace transform used in solution 186–192
  four-point bending test [for ceramic and brittle materials] 441
  indeterminate beam 190–192
  bell-shaped distribution curves 431, 435–437
Bernoulli equation 93, 205–206
  applications 205–206, 207, 212
Bernoulli's law [for fluid dynamics] 63, 200, 393–394, 401
Bessel, Friedrich 56
Bessel equation 56
  modified 57
  special case (order $n=0$) 305
Bessel functions 56–58
  differentiation of 58
  in heat conduction analysis 305, 306, 311
  integration of 58
  modified 58
  recurrence relations 58
bioinformatics 426
biology, statistics used in 426
Bishop, R.H. 3, 24
boundary conditions 9
  in heat conduction analysis 293–295, 299, 303–304
  in vibration analysis
    of cable structures 318
    of membranes/thin flexible plates 331
boundary element method (BEM) 120

“characteristic equations”
in free vibration analysis for cable structures 320

in heat conduction analysis 301, 310, 313
meaning of term 141, 142
chemical industry, fluid mechanics 204
circular track, automobile on 110–111
coil hanger, design analysis 10–13
coefficient matrix 134
conversion into upper triangular matrix 135, 145
cofactor matrix 129, 130
in example 134
coilover [mass–dashpot–spring assembly] 255, 259
examples/problems 270, 272, 281
column matrices 124
multiplication by row matrix 128
transposition of 126
complementary error functions 55
compound bar, finite-element formulation for 414–417
conservation of energy 62, 200
in fluid mechanics 93, 205
in heat transfer 93, 291
conservation of mass 20, 62, 200
in fluid mechanics 93, 206, 212
conservation of momentum 62, 200, 314
constants, definition 26
continuity equation [in fluid mechanics] 93, 206
continuous functions 27–28
average values 52–54
continuous variation of 33–34, 219
in heat transfer analysis 219
continuous ordinary functions, derivatives of 286
continuous process
fluid flow from tank 208
solid–fluid heat transfer 230
contour maps, FEA output 402, 403
control charts 450–456
R-chart 453–456
three-sigma control chart 451–453
convective boundary condition 294–295
convective heat transfer analysis 23–24, 227
forced convection 227
natural convection 227
see also Newton’s cooling law
convolution theorem, inversion of Laplace transforms using 178
cooling chamber, in IC chip thermal cycling test 228, 231, 232–233
Cramer’s rule 120, 135
creativity [of engineers] 2
creep deformation
silicon carbide 438
temperature effects 291, 438
cross product [of two vectors] 84–86
examples 85–86
for plane areas 86
cruise ship, navigation route 81, 88
curl operator [in vector calculus] 91, 92, 93
curve fitting techniques 30–31
least-squares approach 30
scientific functions approach 30–31
spline fitting technique 30
curved-edge plate(s), determination of plane area(s) 39–41
damped vibration 248–249
mathematical modeling of 254–258
damped vibration analysis 248–249
damping force 249, 255
databases, use in statistical analysis 429
dataset(s)
“central tendency” of 431, 432, 433, 434
development in 433
dispersion of data values 433, 434
histogram of 430–431
mean of 431–433
median of 433
mode of 430
normal distribution of 431
standard deviation for 434
variance of data 434
variation of data values 433, 434
decision making [by engineers] 3–5, 427
examples 4–5
types of problems 3–4
definite integrals 37, 38
deformed solids
placements in 406, 410
strain energy in 409, 411–412
del operator [in vector calculus] 91, 92
delta function(s) 60
Fourier transform of 289
see also impulsive functions
Demy, W. Edwards 449
derivatives 31–36
first-order derivatives 35
Laplace transform of 180–181
of functions 34, 317
higher-order derivatives 35–36
Laplace transform of 180–184
recurrence relations 181, 185
mathematical expression of 33–34
orders 35
partial derivatives 36
Laplace transform of 181–184
physical meaning 32–33, 362
second-order derivatives 35
Laplace transform of 181
Desai, C.S. 383
determinants 84, 121–123
compared with matrices 121
evaluation of 121–123
size reduction of 122
deterministic theory in design analysis 7, 17–19, 427
compared with statistical approach 427, 439, 443–444
use precluded for ceramic and brittle materials 439
development [of data from mean value] 433
diagonal matrices 125
die stamping machine see metal stamping machine
differential equations
fourth-order, solution of 187
Laplace transform method for solving 184–195
laws of physics for derivation of 25, 62–65
numerical methods for solving 361–374
see also first-order ordinary differential equations; partial differential equations;
second-order ordinary differential equations

Dirichlet condition 294, 295
discontinuous linear function 154
dispersion [of data values in dataset] 433, 434
displacement vectors 82
divergence operator [in vector calculus] 91, 92, 93, 292
dot product [of two vectors] 82–84
examples 82–83
dynamic analysis 95

economics, statistics used in 426
eigenfunctions 141–148
applications 146–148
meaning of term 141, 142
eigenvalues 141–148
applications 146–148
physical meaning 141, 142
of square matrices 142–146
eigenvectors
physical meaning 142
of square matrices 142–146
Einstein, Albert, quoted 2
electromagnetism
discovery 94
permittivity 427
vector calculus used 94–95
electronics and communications, statistics used in 426
element equations [in FEA] 383, 394
derivation of 394–397
Galerkin method 395–396
Rayleigh–Ritz method 394–395, 396–397
elimination process [in Gaussian elimination method] 135
recurrence relationships for 137
empirical formulas [in engineering analysis] 21–24
examples of use 22–24
engineering analysis applications
eigenfunctions and eigenvalues 146–148
higher-order derivatives 35–36
vector calculus 92–95
concept 1, 62
and engineering practices 2–5

stage 1 [identification of physical problem] 8–9
examples 10, 11, 14, 15
stage 2 [idealization for mathematical modeling] 9, 381
examples 11–12, 15
stage 3 [mathematical modeling and analysis] 10, 381
examples 12–13, 15–16
stage 4 [interpretation of results] 10, 381
examples 13, 16–17
“toolbox” for 5–8
engineering design procedure 7–8
design analysis 8
design optimization 8
design synthesis 8
engineering practice, statistics used in 427
engineering problems
physical nature 6
solution by engineering analysis 6–7
engineers
achievements by 2
creativity 2
decision making by 3–5, 427
problem solving by 2–3
public responsibility 3, 18
risk assessment by 5
error functions 55
Euler–Bernoulli equation
differential form 186
Laplace transform used in solving 191–192
fabrication methods, uncertainties in 428
factor of safety see “safety factor”
“failure by weakest link” model [for ceramic and brittle materials] 439
Faraday’s right-hand rule 94
Ferziger, J.H. 339, 348, 362, 367
Fick’s law [for diffusion] 200
finite difference, meaning of term 362–363
finite-difference method (FDM) 25–26, 120, 131, 132, 287
finite-difference schemes 363–366
backward difference scheme 364
central difference scheme 364
examples 364–366
factors affecting accuracy 366, 367
forward difference scheme 363
for partial derivatives 366–367
finite-element analysis (FEA) 132–133, 381–424
element equations 383, 394
derivation of 394–397
elements 132, 383, 384, 385, 419
bar elements 384, 385
“birth-and-death” elements 419
hexahedral elements 384, 385, 409
large-aspect-ratio elements 419
quadrilateral plate elements 384, 385
“serendity” elements 419
tetrahedral elements 384, 385, 409–410
thin-shell elements 419
toroidal elements 384, 385
triangular plate elements 384, 385
general-purpose codes 382, 417–422
interpolation functions 388
derivation of 388–393
derivation for simplex elements with scalar quantities at nodes 388–390
derivation for simplex elements with vector quantities at nodes 388–390
nodes 132, 383
output 401–403
animation 403
contour maps 402, 403
tabulated data 403
overall stiffness equations, derivation of 397–398
primary unknown quantities 132, 387
identification of 132, 387–388, 410
solution for 398–401
principle of 383
secondary unknown quantities 387, 388
solution for 401
step 1: discretization of real structures 383–387, 403
step 2: identification of primary unknown quantities 132, 387–388
step 3: derivation of interpolation functions 388–393
step 4: definition of relationships between actions and induced reactions 393–394
step 5: derivation of element equations 394–397
step 6: derivation of overall stiffness equations 397–398
step 7: solution for primary unknown quantities 398–401
step 8: solution for secondary unknown quantities 401
finite-element method (FEM) 25–26, 120, 131, 132, 287
benefits 382
elastic stress analysis of solid structures 403–417
finite-element formulation 409–413
finite-element formulation for one-dimensional solid structures 413–417
meaning of “displacements” 406
meaning of “strains” 406–407
meaning of “stresses” 404–406
normal strain components 406
normal stress components 405, 406
shearing strain components 406
shearing stress components 405, 406
strain–displacement relations 407–408
strain energy in deformed elastic solids 409
stress–strain relations 408
literature on 382
use in aircraft design analysis 18–19
first-order derivatives 35
Laplace transform of 180–181
first-order ordinary differential equations
applications
fluid mechanics analysis 204–217
heat transfer analysis 217–233
rigid body dynamics under influence of gravitation 233–237
solution methods 200–204
integration 200–204, 220, 221
for linear, homogeneous equations 201–202
for linear, nonhomogeneous equations 202–204
Runge–Kutta method 367–370
for separable differential equations 200–201, 208
flexural rigidity [of beam structure] 186
fluid mechanics
Bernoulli’s law [and equation] 63, 93, 200, 205–206, 207
continuity equation 93, 206

oscillatory motion
  amplitude 246
  frequency 246
  period 246
see also mechanical vibration

P
parabolic curve, solid volume of revolution 45
parallelepiped, determination of volume by triple product [of three vectors] 87–88
parallelogram, determination of area by cross product [of two vectors] 86
parallelogram law, summation of vectors using 79
parameters
  definition 26, 171
  transformation of variables into 171
paratroopers, rigid-body dynamics under influence of gravitation 235–237
partial derivatives 36, 285–286, 317
finite-difference formulation for 366–367
Laplace transform of 181–184
spatial or temporal variables in 285
partial differential equations
  for heat conduction in solids 291–298
  meaning of term 199, 285, 287
  solution methods 287–290
    Fourier transform method 287, 288–290
    Hankel transform method 287
    integral transform methods 287, 288–290
    Laplace transform method 30, 192–195, 287, 288, 299
    numerical solution methods 287
    trial functions method 287
  solution for steady-state heat conduction analysis 308–313
  solution for transient heat conduction analysis 298–307
  solution for transverse vibration of cable structures 318–322
  solution for transverse vibration of membranes [thin plates] 331–334
  for transverse vibration of cable structures 314–328
  for transverse vibration of membranes [thin plates] 328–336
partial fraction method, inversion of Laplace-transformed function by 176–177
perforated plate
  stress analysis of 131
  with tapered edges, stress analysis of 132–133
periodic continuous sinusoidal functions 153, 154
periodic functions
  correlation with Fourier series, effect of number of terms 163–164
  representation by Fourier series 152–154, 155–156
periodic phenomena 151
  examples 151–152
periodic piecewise continuous linear signal 154, 158
Fourier series for 158–159
periodic “sawtooth” function
  Fourier series for 157–158
  graphical representation 157
oscilloscope signal 154
periodic sinusoidal function
Fourier series for  156–157
graphical representation  156
oscilloscope signal  154, 156
permittivity [in electromagnetism]  427
physical problems
idealization of [for mathematical modeling] 9, 381, 427
examples  11–12, 15, 381
identification of  8–9
examples  10, 11, 14, 15
physical quantities
in electromagnetism  94
representation [in engineering analysis] 27–29, 73, 151
physics
laws of  62–63, 199–200, 393–394
statistics used in  427
piecewise continuous functions  28–29
piecewise continuous periodic functions  153, 154
convergence of Fourier series for  166–169
Fourier series for  159–161
graphical representation  153, 159
pipes
bend loss coefficient  23
convective heat transfer analysis  23–24
pressure drop in fluid flow  22–23
see also gas pipelines; oil pipelines
plane areas  47–52
plane areas, determination of
by cross product [of two vectors]  86
by integration  38–42
Poisson’s ratio  408, 427
politics, statistics used in  427
polynomial function curve-fitting technique  30–31
position vector function
projectiles  100, 101, 102
rigid body in curvilinear motion  98, 104, 109
rigid body in rectilinear motion  95
position vectors  75–78, 90
in 2D plane  75, 76, 81
in 3D space  75–76
power transmission structures, vibration of  314
Prandtl number  24, 227
pressure vessels, design analysis  18
pressurized process reactor  32–33
probabilistic design analysis  439, 443–447
probability $P$ [of fracture of structure]  443, 444
reliability $R$ of structure  443, 444
volume effect  444
probability density function  435
probability ($P$) of fracture of structure  443–444
probability theory  427, 435
problem solving [by engineers]  2–3
product development
automobile braking system case study  421, 422
cost saving in  420, 422
general processes involved  421
simulation by FE codes  420–422
product quality
balance between improved quality and cost of improvements  447–448
factors affecting  447
poor quality causes  447
effects  447
projectiles
kinematic analysis  100, 101
attainable range  103
impact velocity  103
maximum attainable height  102–103
position vector function  100, 101, 102
vector calculus used  100–103
public liability/responsibility [of engineers]  3, 18
Pythagorean rule  75
$q$
quadrilateral plate elements [in FEA]  384, 385
interpolation functions  388
quadrilateral plate structure, finite-element model  397–398
quarter-circular plate, determination of plane area  39
$r$
R-chart  453–456
radius vector  75–76
ramp function, Laplace transformation carried out on  172–173
real numbers 26
rectangular matrices 123
multiplication by column matrix 128
transposition of 126
recurrence relations
for “back substitution” 137, 140
of Bessel functions 58
in Gaussian elimination 135, 137, 138
for Laplace transform of $n$th-order derivatives
181, 185
for Laplace transform of step functions 188
in matrix algebra 127
reservoirs and tanks
fluid flow in 205–209
fluid mechanics
derivation of differential equations 207–208
solution of differential equations 208–209
resonant vibration
amplitude 267–268
cable structures 314
damage caused by 247, 314
mass–spring system 266–273
structures 141, 268
resultant matrix 134
Reynolds number 24, 227
right solid cone, determination of volume 44–45
right [angled] triangle, determination of plane area 38
rigid body dynamics 95
plane curvilinear motion
in cylindrical coordinates 102–108
with normal and tangential components 109–111
in rectangular coordinates 97–100
rectilinear motion 95–97
under influence of gravitation, first-order ordinary differential equations used
233–237
vector calculus used 95–114
risk assessment [by engineers] 5
rod spring [in mass–spring system] 252
example 253–254
Rosenkrantz, W.A. 426, 454
row matrices 124
multiplication by column matrix 128
Runge, C. 367
fourth-order method 369–370
for higher-order differential equations 370–374
second-order method 367–369
safety factors” [in engineering analysis] 17–19, 382, 443
in example calculation 17
typical factors 18
San Francisco
Lombard Street 88, 89
