INDEX

Ab initio calculations:
  hydrogen-atom translocation, 19–22
  hypericin ground state heterogeneity, 9–10
thiophosgene electronic states:
  carbon-sulfur double bonds, 32–34
  first triplet electronic state (T1), 52–56
  second singlet excited state (S2), 57–64
Add-on toning, Dylux technology and, 237–238
Adduct formation, Paternò-Büchi reaction, furan derivatives, 88–92, 98–103
Agfa-Gevaert, competition to Dylux from, 245–246
Aldehydes, Paternò-Büchi reaction:
  asymmetric furan reactions, 111–116
  2,3-dihydrofuran, 93–95
  furan compounds, 84–92
Allylic alcohols, Paternò-Büchi reaction,
  asymmetric furan reactions, 114–116
Analytical Hessian calculations, hypericin ground state heterogeneity, 9–10
Antibonding electron density, thiophosgene molecules, first excited singlet state (S1 (n,π*)), 45–47
Aromaticity, Paternò-Büchi reaction, non-furan compounds, 122–123
Asteltoxin formation, Paternò-Büchi reaction, furan derivatives, 98–103
Asymmetric reactions, Paternò-Büchi reaction, furan derivatives, 103–116
Atomic coefficients, Paternò-Büchi reaction, furan compounds, 89–92
Automatic clinical analyzer, Dylux technology and, 215–217
Avenaciolide, Paternò-Büchi reaction, furan derivatives, 100–103
Azaindole, Paternò-Büchi reaction, 122
Balon, Walter, 149–150
Band contour analysis, thiophosgene molecules:
  first triplet electronic state (T1), 53–56
  second singlet excited state (S2), 59–64
BBO crystals, hypericin ground state heterogeneity analysis, 12–15
Benzaldehyde, Paternò-Büchi reaction:
  asymmetric furan reactions, 112–116
  2,3-dihydrofuran, 93–95
  furan compounds, 88–92
Benzene, Paternò-Büchi reaction:
  2,3-dihydrofuran, 93–95
  furan derivatives, 87–92
Benzofuran, Paternò-Büchi reaction, 92–93
Benzophenone, thiophene, Paternò-Büchi reaction, 117

263
Biimidazoles:
HABI chemistry and synthesis of, 139–141
permanent color and, 145–147
TCTM-HABI chemistry and, 223–224
ultraviolet light and, 160–161
Biradical intermediates, Paterno-Buchi reaction:
asymmetric reactions, 107–116
2,3-dihydrofuran, 93–95
furan compounds, 85–92
Black Dylux 535 product, development and patenting of, 234–237
Bleistine, Cy (Mrs.), 139
Blue-line technology, Dylux papers and, 196–197
Boeing project, Dylux technology and, 183–184
Booth, Bruce (Dr.), 216–217
Born-Oppenheimer states, thiophosgene molecules,
first excited singlet state \( (S_1 (n,\pi^*)) \), 64–72
Botsolas, Philip, 212–213
Brannock gauge, development of, 166–167
Breslow, Ron, 144
Business planning, Dylux development and, 184–185
Butacite®, development of, 135, 143
Carbon-sulfur double bonds, thiophosgene molecules, 28–29
electronic states, 32–34
first triplet electronic state \( (T_1) \), 50–56
second singlet excited state \( (S_2) \), 56–64
Carbonyl compounds:
1,2-cycloaddition reaction:
Paterno-Buchi reaction:
  furan derivatives, 83–116
  asymmetric reactions, 103–116
  benzofuran, 92–93
  2,3-dihydrofuran, 93–95
  furan, 83–92
  synthetic applications, 96–103
non-furan pentaatomic heterocycles,
  116–123
  azaindole, 122
  imidazole, 119–120
  indole, 120–121
  pyrrole, 117–118
  reactivity observations, 122–123
  selenophene, 118–119
  thiazole, isoxazole, and isothiazole, 120
  thiophene, 116–117
research background, 82–83
hypericin interaction with, 17–19
thiophosgene electronic states, second singlet excited state, 75–76
Cathode ray tube (CRT) imaging:
  Boeing project involving, 183–184
  HABI chemistry and, 176–177
  Cavity ring-down (CRD) experiments, thiophosgene molecules, first triplet electronic state \( (T_1) \), 49–56
CDM-HABI compound:
development of, 165–166
TCTM-HABI development and, 223–227
Chilton, Tim, 151–152
China, Dylux technology marketing in, 239–240
Chiral phenylglyoxylates, Paterno-Buchi reaction, furan derivatives, 104–116
Chloranil (tetrachlorobenzophenone), spirit duplication systems and, 147–148
\( \alpha\)-Cl-HABI:
  chemistry of, 223–224
  Photomarker® Corp. technology and, 228
  photopolymerization and, 255–256
  Thermal Dylux® proofpaper and, 253–255
Chlorine isotope effects, thiophosgene molecules, 29
Cis isomers, Paterno-Buchi reaction, asymmetric furan reactions, 113–116
Cohen, Robert (Dr.), 160, 165, 168–169, 173
Color-overlay film, Dylux technology for, 218–221
Commercial product development, Dylux technology and, 251
Competition, for Dylux technology, 245–251
Computer simulation, Dylux technology and, 207–209
Computer to plate (CTP) technology:
development of, 251
  Thermal Dylux® proofpaper, 252–255
Condon approximation, thiophosgene molecules, first excited singlet state \( (S_1 (n,\pi^*)) \), 64–72
Continuum generation, hypericin ground state heterogeneity analysis, 11–15
Copiart product, patents for, 248–250
INDEX

Corfam®, 166–167, 203
Cronapaque®, photo-oxidation and, 153
1,2-Cycloaddition reaction, carbonyl and pentaatomic heterocyclic compounds:
  Paternò-Buchi reaction:
    furan derivatives, 83–116
    asymmetric reactions, 103–116
    benzofuran, 92–93
    2,3-dihydrofuran, 93–95
    furan, 83–92
    synthetic applications, 96–103
    non-furan pentaatomic heterocycles, 116–123
    azaindole, 122
    imidazole, 119–120
    indole, 120–121
    pyrrole, 117–118
    reactivity observations, 122–123
    selenophene, 118–119
    thiazole, isoxazole, and isothiazole, 120
    thiophene, 116–117
    research background, 82–83
  Dark state analysis, thiophosgene molecules, second singlet excited state (S2), 73–76
  Dayton, Herb, 139
  Deactivation speed, imaging technology and, 168–173
  de Campi, John, 187–188
  Decay curve lifetime measurements, thiophosgene molecules:
    first excited singlet state (S1 (n,π*)), 68–72
    second singlet excited state (S2), 73–76
  Deuterium isotope effect:
    absence of, in excited-state intramolecular H-atom transfer, hypericin and hypocrellin, 6–7, 17–19
    hydrogen-atom translocation and, 19–22
  Deutsch, Albert, 155
  DFF filter technology:
    Dylux applications for, 213–214
    portable copiers and, 217–218
  Diastereoisomeric excess, Paternò-Buchi reaction, asymmetric furan reactions, 104–116
  Dichroic beam splitter techniques, hypericin ground state heterogeneity analysis, 12–15
  2,3-Dihydrofuran, Paternò-Buchi reaction, 93–95
  Dihydropyridines (DHP), add-on toning technology and, 237–238
  Dimethylsulfoxide (DMSO), hypericin ground state heterogeneity analysis, 13–15
  Dipole moment operator, thiophosgene molecules, first excited singlet state (S1 (n,π*)), 36–47
  Double minimum potential, thiophosgene molecules, first excited singlet state (S1 (n,π*)), 42–47
  Dual response imaging systems:
    patents for, 192
    updating of, 233
  DuPont Company:
    Apex programs at, 134
    development of Dylux® system at, 133–135
    Orchem division at, 134–135
    Photo Products Department at, 134–135, 202–204, 233–234
    Radiation Physics Laboratory, 157–163
    venture concept at, 134, 177–178
  Dylux 503:
    limitations of, 200–201
    watermark applications, 251–252
  Dylux 503B, Copiart technology and, 250
  Dylux®-4C overlay films, development of, 218–221
  Dylux® instant-access imaging materials:
    add-on toning system, 237–238
    Black Dylux® 535 proofpaper, 234–237
    Botsolas’ contributions to, 212–213
    cathode ray tube imaging, 176–177
    Cescon’s work on, 137
    Chinese operations, 240
    commercial product development, 251
    competition against, 245–251
    computer simulation techniques, 207–209
    DFF filter development, 213–214
    dual response systems, 233
    DuPont research on, 133–135
    European operations, 197–198, 215
    foot imaging technology, 166–167
    GTE-Sylvania home of office copier, 217–218
    higher speed systems, 168–173
    polymerization initiation, 171–172
    historical assessment of, 257–259
    historical evolution of, 135–137
    J.C. Penney inventory control project, 229–230
    Kalography development, 186–187
Dylux® instant-access imaging
materials (Continued)
large wall-screen displays, 183–184
limitations of, 200–201
literature sources on, 141–143, 257
management changes and, 172–173
marketing efforts, 178–189
business planning, 184–185
de Campi’s contributions, 187–188
Mattel’s involvement with, 188–189
point-of-sales opportunities, 179
Wilbur’s contributions, 178–179
medical imaging systems, 215–217
microfilm market for, 173–176
military applications, 199–200
operations restructuring, 202–204
optical printing, 167–168
opto-magnetic printing, 185–186
origin of name, 181–182
overlay film development, 218–221
patent history and documentation, 138–145
patent statistics, 259–260
permanent color development, 145–165
applications, 151–152
Looney’s research on, 155–157
optimization experiments, 164
patents for, 164–165
radiation physics laboratory research, 157–163
stabilization problems, 152–155
phenidone technology, 222–223
photodecoration applications, 204–207, 218
Photoimaging, Ltd. formed, 244–245
Photomarker® Corp., 227–228
photopolymerization patent, 238
photopaper products, 255–256
Photo Products difficulties, 228–229
phototropic materials, 137–138
proofing technology, 168, 190–191
proofpaper properties, 193–197
research background, 132–133
rewards and awards for, 260–261
SPSE meeting introduction of, 191–192
SPSE Tokyo meeting, 230–232
TCTM-HABE process, 223–227
technological improvements in, 165–168
thermal Dylux® proofpaper, 252–255
transfer to Photo Products, 233–234
Universal Product Code operations, 209–212
UVI movie production, 179–181
venture capital for, 177–178
W. H. Brady Co. and, 186–187
Wartell’s contributions to, 189–198
watermarks, 251–252
xeroprinting technology, 241–244
X-Raylux invention, 232–233

Eastman Kodak, competition to Dylux from,
246–247
Electron configurations, thiophosgene electronic
states, 29–34
Electronic integral, thiophosgene molecules, first
excited singlet state (S1 (n,π*)), 65–72
Electronic matrix elements, thiophosgene
molecules:
first excited singlet state (S1 (n,π*)), 65–72
second singlet excited state (S2), 72–76
Electronic states, thiophosgene molecules,
29–64
basic properties, 28–29
first excited singlet state (S1 (n,π*)), 36–47
first triplet electronic state (T1), 47–56
ground electronic state (S0), 34–36
molecular orbitals and electron configurations,
29–34
second singlet excited state (S2), 56–64
Electro-optical printing, UPC-Dylux technology
for, 211–212
Electrophotography, xeroprinting and, 241–244
Ellefson, Bob, 203–204
Endo selectivity, Paternò–Büchi reaction, 2,3-
dihydrofuran, 94–95
Energy level diagram:
thiophosgene electronic states:
first excited singlet state (S1 (n,π*)),
40–47
molecular structure, 33–34
second singlet excited state (S2), 73–76
Equilibrium geometry, thiophosgene molecules,
variation in, 77–78
Esters, Paternò–Büchi reaction:
asymmetric reactions, 107–116
furan compounds, 88–92
o-EtO-HABI, add-on toning technology and,
237–238
European expansion, of Dylux technology,
197–198, 215
Excited-state intramolecular H-atom transfer:
hydrogen-atom translocation, 19–22
hypericin-like perylene quinones, 2–7
Excited-state kinetics, multiple hydrogen-atom transfers in perylene quinones, 15–20

*Exo* stereoselectivity, Paternò-Büchi reaction: 2,3-dihydrofuran, 95
furan derivatives, 86–92
Exposure equipment, for Dylux development, 178–179
Fabricius, Dietrich, 253
Fermi correlation, thiophosgene molecules, first triplet electronic state (T1), 50–56
Firmani, Ray, 173
First excited singlet state (S1 (n,π*)), thiophosgene molecules:
  - basic properties, 36–47
  - Herzberg notation, 31–34
  - photophysical properties, 64–72
First triplet electronic state (T1), thiophosgene molecules, 47–56
Flexible filter, Dylux technology and, 213–214
Fluorescence breakoff, thiophosgene electronic states, first excited singlet state (S1 (n,π*)), 70–72
Fluorescence depletion (FD), thiophosgene molecules, second singlet excited state (S2), 74–76
Fluorescence spectra:
  - excited-state intramolecular H-atom transfer, hypericin and hypocrellin, 2–7
  - multiple hydrogen-atom transfers in perylene quinones, 17–19
  - thiophosgene electronic states:
    - first excited singlet state, 66–72
    - first triplet electronic state (T1), 54–56
    - ground electronic state, 36–37
  - thiophosgene molecules:
    - first excited singlet state (S1 (n,π*)), 45–47
    - second singlet excited state (S2), 57–64
Foot imaging, HABI chemistry and, 166–167
Fourier transform analysis:
  - thiophosgene electronic states, first triplet electronic state (T1) lifetimes, 55–56
  - thiophosgene molecules, first excited singlet state (S1 (n,π*)), 67–72
Franck-Condon factors, thiophosgene molecules:
  - basic properties, 29
  - first excited singlet state (S1 (n,π*)), 38–47, 65–72
  - first triplet electronic state (T1), 52–56
Frequency calculations, hydrogen-atom translocation, 19–22
Friar, Larry, 168
Fuji Photofilm, competition to Dylux from, 247–250
Furan derivatives, Paternò-Büchi reaction, 83–116
  - asymmetric reactions, 103–116
  - benzofuran, 92–93
  - 2,3-dihydrofuran, 93–95
  - furan, 83–92
  - synthetic applications, 96–103
Furfural derivatives, Paternò-Büchi reaction, furan compounds, 88–92
2-Furylmethanol, Paternò-Büchi reaction, furan compounds, 91–92
Gardner-Kasha supposition, thiophosgene electronic states, first excited singlet state, 66–72
*Gauche* interactions, Paternò-Büchi reaction, 2,3-dihydrofuran, 94–95
Gaussian terms, thiophosgene molecules, first excited singlet state (S1 (n,π*)), 44–47
Glyoxylates, Paternò-Büchi reaction, furan derivatives, 103–116
Grenewalt, Crawford, 167
Griesbeck rule, Paternò-Büchi reaction, asymmetric furan reactions, 114–116
Ground electronic state (S0):
  - thiophosgene electronic states, first triplet electronic state (T1) lifetimes, 55–56
  - thiophosgene molecules, 34–36
Ground-state heterogeneity, hypericin-like perylene quinones, 7–15
Gruebele Hamiltonian, thiophosgene electronic states, second singlet excited state, 75–76
GTE-Sylvania home office copier, Dylux technology and, 217–218
Half-wave plate techniques, hypericin ground state heterogeneity analysis, 11–15
Hammett free energy correlation, Paternò-Büchi reaction, asymmetric furan reactions, 115–116
Hammond, George (Dr.), 144
Hanson, Victor F., 157–158
Haven, Alfred C., 150–151
Herzberg notation, thiophosgene electronic states, 30–34
Herzberg-Teller coupling, thiophosgene molecules, first excited singlet state \((S_1 (n,\pi^*))\), 38–47

Hessian matrices:
- hydrogen-atom translocation, 19–22
- hypericin ground state heterogeneity, 9–10

Hexaarylbimidazole (HABI) chemistry:
- Dylux instant-access imaging using:
  - add-on toning system, 237–238
  - Black Dylux® 535 proofpaper, 234–237
- Botsolas’ contributions to, 212–213
- cathode ray tube imaging, 176–177
- Cescon’s work on, 137
- Chinese operations, 240
- commercial product development, 251
- competition against, 245–251
- computer simulation techniques, 207–209
- DFF filter development, 213–214
- dual response systems, 233
- DuPont research on, 133–135
- European operations, 197–198, 215
- foot imaging technology, 166–167
- GTE-Sylvania home office copier, 217–218
- historical assessment of, 257–259
- historical evolution of, 135–137
- imaging speed technology, 168–173
- polymerization initiation, 171–172

J.C. Penney inventory control project, 229–230
- Kalography development, 186–187
- large wall-screen displays, 183–184
- limitations of, 200–201
- literature sources on, 141–143, 257
- management changes and, 172–173
- marketing efforts, 178–189
- business planning, 184–185
- de Campi’s contributions, 187–188
- Mattell’s involvement with, 188–189
- point-of-sales opportunities, 179
- Wilbur’s contributions, 178–179
- medical imaging systems, 215–217
- microfilm market for, 173–176
- military applications, 199–200
- operations restructuring, 202–204
- optical printing, 167–168
- opto-magnetic printing, 185–186
- origin of name, 181–182
- overlay film development, 218–221
- patent history and documentation, 138–145
- patent statistics, 259–260

permanent color development, 145–165
- applications, 151–152
- Loone’s research on, 155–157
- optimization experiments, 164
- patents for, 164–165
- radiation physics laboratory research, 157–163
- stabilization problems, 152–155
- phenidone technology, 222–223
- photodecoration applications, 204–207, 218
- Photoimaging, Ltd. formed, 244–245
- Photomarker® Corp., 227–228
- photopolymerization patent, 238
- photopolymer products, 255–256
- Photo Products difficulties, 228–229
- phototropic materials, 137–138
- proofing technology, 168, 190–191
- proofpaper properties, 193–197
- research background, 132–133
- rewards and awards for, 260–261
- SPSE meeting introduction of, 191–192
- SPSE Tokyo meeting, 230–232
- TCTM-HABE process, 223–227
- technological improvements in, 165–168
- thermal Dylux® proofpaper, 252–255
- transfer to Photo Products, 233–234
- Universal Product Code operations, 209–212
- UVI movie production, 179–181
- venture capital for, 177–178
- W. H. Brady Co. and, 186–187
- Wartell’s contributions to, 189–198
- watermarks, 251–252
- xeroprinting technology, 241–244
- X-Raylux invention, 232–233
- fatigue properties of, 144
- oxidation systems patent, 148–149
- spectral properties, 153–154

Highest occupied molecular orbital (HOMO),
- Paterno-Büchi reaction:
  - 2,3-dihydrofuran, 95
  - furan compounds, 89–92
- Human serum albumin, hypericin interaction
  with, 17–19

Hydrogen atom transfer rate:
- excited-state intramolecular H-atom transfer,
  - hypericin and hypocrellin, 5–7
- excited-state intramolecular transfer in
  - hypericin, 2–7
hypericin ground state heterogeneity, 7–15
multiple transfers, perylene quinones, 15–19
Hydrogen atom translocation, vibrational
calculations, 19–22
Hydrogen bonding, Paternò-Büchi reaction,
asymmetric furan reactions, 113–116
Hydroquinone derivatives, HABI chemistry and,
153–154
5-Hydroxytropolone, hydrogen-atom transfer in,
7–8
Hyperfine coupling (HFC), Paternò-Büchi
reaction, furan derivatives, 86–92
Hypericin-like perylene quinones:
excited-state intramolecular H-atom transfer,
2–7
ground-state heterogeneity, 7–15
hydrogen atom translocation, 19–22
multiple hydrogen-atom transfers, 15–19
Hypocrellins: excited-state intramolecular H-atom transfer in,
2–7
ground-state heterogeneity in, 7, 9
hydrogen-atom translocation, 19–22
multiple hydrogen-atom transfers in, 15–19
Hypomycin B, multiple hydrogen-atom transfers in,
15–19
Image-forming materials, patents for, 248–250
Imaging speed technology, HABI chemistry and,
168–173
polymerization initiation, 171–172
Imidazole, Paternò-Büchi reaction, 119–120
Imidazolyl radical:
HABI chemistry, 144–145
thermally activated imaging, 156
Indole, Paternò-Büchi reaction, 120–121
Infrared (IR) spectroscopy:
hypericin-like quinones, hydrogen atom
translocation, 20–22
thiophosgene electronic states, ground
electronic states, 36
In-plane totally asymmetric mode, thiophosgene
molecules, first excited singlet state, 65–72
In-plane totally symmetric modes, thiophosgene
molecules, first excited singlet state, 65–72
Internal conversion (IC) process, thiophosgene
molecules:
first excited singlet state (S_1 (n,\pi^*)), 65–72
second singlet excited state (S_2), 72–76
symmetry absence, 77
Intersystem crossing (ISC), thiophosgene
molecules:
first excited singlet state (S_1 (n,\pi^*)), 71–72
first triplet electronic state (T_1), 51–56
Intramolecular excited-state intramolecular H-
atom transfer, in hypericin, 2–7
Intramolecular vibrational energy redistribution
(IVR), thiophosgene electronic states:
first excited singlet state (S_1 (n,\pi^*)), 70–72
first triplet electronic state (T_1) lifetimes,
55–56
ground electronic state, 36
Inventory control, Dylux technology and,
229–230
Inversion doubling splittings, thiophosgene
molecules, 29
first excited singlet state (S_1 (n,\pi^*)), 44–47
first triplet electronic state (T_1), 50–56
second singlet excited state (S_2), 59–64
Isatine derivatives, Paternò-Büchi reaction,
asymmetric furan reactions, 110–116
Isothiazole, Paternò-Büchi reaction, 120
Isoxazole, Paternò-Büchi reaction, 120
James, Dan (Dr.), 163
Japan, Dylux research presented in, 230–232

α-Nitroaromatic photoinhibitor, patent for, 233
Nonradiative lifetime, thiophosgene molecules, first triplet electronic state (T1), 52–56
“Normal” form hypericin, ground state heterogeneity in, 10–11
N-pyridylsydnone (N-PS), photochromic properties of, 136–137
Nuclear kinetic energy operator, thiophosgene molecules, first excited singlet state (S1 (n, p*)), 64–72
Nuclear magnetic resonance spectroscopy: hypericin-like quinones, ground-state heterogeneity, 9
Paternò-Büchi reaction, furan compounds, 83–92
Nuclear Overhauser effect (NOE) analysis, Paternò-Büchi reaction:
asymmetric furan reactions, 115–116
furan compounds, 84–92
One-photon excitation, thiophosgene molecules, 77
Optical-optical double resonance (OODR) spectroscopy, thiophosgene molecules:
basic properties, 28–29
first excited singlet state (S1 (n, p*)), 46–47
lifetime results, 66–72
first triplet electronic state (T1), 49–56
second singlet excited state (S₂), 56–64
fluorescence depletion, 74–76
Optical parametric amplifier pump, hypericin
ground state heterogeneity analysis, 10–15
Optical printing, HABI chemistry and,
167–168
Optimization, HABI chemistry and, 160
Opto-magnetic printing, Dylux technology and,
185–186
Out-of-plane motion, thiophogene molecules:
first excited singlet state (S₁ (n,π*))), 44–47, 65–72
second singlet excited state (S₂), 56–64
Overlaid film, Dylux technology for, 218–221
Overlap integral, thiophogene molecules, first
excited singlet state (S₁ (n,π*)), 65–72
Oxetane formation, Paternò-Büchi reaction:
furan derivatives, 96–103
pyrrole, 117–118
Oxetanocin formation, Paternò-Büchi reaction,
furan derivatives, 102–103
Panar, M., 202–204
Paris, Jean, 143
Patents:
automatic inventory control technology, 230
biimidazoles, 140–141
coi-irradiation method for producing positive
images utilizing phototropic spiropyrans
or indenone oxide or dual response
photosensitive composition, 192
coi-irradiation system for producing positive
images, 192
dimers derived from unsymmetrical 2,4,5-
triphenylimidazole compounds as
photoinitiators, 226–227
direct-positive photoimaging material for
electrographic master preparation, 243
dry silver-free photographic process, 158
dual-response photosensitive compositions
containing acyl ester of triethanolamine, 195
dual-response photosensitive compositions
containing alkylbenzenesulfonic acid and
arene sulfonamide, 196
elements for forming print-out images, 250–251
flexible ultraviolet radiation transmitting
filters, 214
heat-bleachable composition useful in
photography, 246–247
heat-sensitive reactive products of
hexaarylbimidazole and antihalation
dyes, 247
hexaarylbimidazole oxidation systems, 148–150
hexaarylbisimidazole oxidation systems, 149–150
image-producing layer of nearly uniform
thickness for holography, 175–176
imaging and fixing radiation-sensitive
compositions by sequential irradiation, 169–170
imaging composition, 246
leuco compounds oxidizable to dyes, 235
leuco dye/hexaarylbimidazole thermally
activated imaging process, 156
leuco dye photocopy system, 149
leuco triarylmethane/hexaarylbimidazole
color forming system with deactivator, 159–160
light-sensitive composition of organic color-
generator, photooxidant and organic
thermally activable reducing agent
progenitor, 154–155
marking transfer sheets, 212
method for preparing positive and negative
images using photohardenable
electrostatic master, 242–243
microencapsulation technologies, 248–250
nonphotosensitive, thermally imageable
element having improved room light
stability, 254
photoactivatable hexaarylbimidazole-
coumarin compositions, 160
photodecorating sheet material with matched
colored designs, 206–207
photohardenable electrostatic master having
improved backtransfer and charge decay, 242
photoimaging systems with cyclic hydrazides, 222
photopolymerizable composition containing
o-nitroaromatic photoinhibitor, 233
photopolymerizable compositions and
elements, 171–172
photosensitive composition, 148
Patents (Continued)

photosensitive composition comprising organic nitrogen-containing color-generator, photo-oxidant, and redox couple, 159
photothermographic reproduction system and photosensitive materials, 245–246
portable copier using flash lamp article, 217–218
preparation of papers coated on both sides with photosensitive composition, 194
research on HABI and searching of, 164–165
storage-stable, light-sensitive composition, aminotriaryl-methane and organic photooxidant, 149
storage-stable photoimageable deuteroleuco dye/photooxidation compositions with improved leuco dye, 250
thermally imageable monochrome proofing product with high contrast and fast photospeed, 253–254
triphenylmethane dyes, 156
2,4,5-triphenylimidazole dimers, 140
universal product code marking composition containing photosensitive dye former, pigment, and binder, 210
visible light-activated phototropic compositions comprising a hexaarylbiimidazole and bist(alkylamino)acridine dye, 163
visible light-activated phototropic compositions comprising a hexaarylbiimidazole and hydroxyphthalain dye, 163
visible light-sensitive phototropic compositions comprising hexaarylbiimidazole and carbocyanine dye, 160, 163
xeroprinting with photopolymer master, 241–244
Paterno-Büchi reaction:
visible light-activated phototropic compositions comprising a hexaarylbiimidazole and bist(alkylamino)acridine dye, 163
visible light-activated phototropic compositions comprising a hexaarylbiimidazole and hydroxyphthalain dye, 163
visible light-sensitive phototropic compositions comprising hexaarylbiimidazole and carbocyanine dye, 160, 163
xeroprinting with photopolymer master, 241–244
indole, 120–121
pyrrole, 117–118
reactivity observations, 122–123
selenophene, 118–119
thiazole, isoxazole, and isothiazole, 120
thiophene, 116–117
Pentaatomic heterocyclic compounds, 1,2-cycloaddition reaction, Paterno-Büchi reaction:
furan derivatives, 83–116
asymmetric reactions, 103–116
benzofuran, 92–93
2,3-dihydrofuran, 93–95
furan, 83–92
synthetic applications, 96–103
non-furan pentaatomic heterocycles, 116–123
azaindole, 122
imidazole, 119–120
indole, 120–121
pyrrole, 117–118
reactivity observations, 122–123
selenophene, 118–119
thiazole, isoxazole, and isothiazole, 120
thiophene, 116–117
Permanent color, HABI chemistry and, 145–151
Perturbation gaps, thiophosgene molecules:
first triplet electronic state (T1), 47–56
second singlet excited state (S2), 62–64
Perylenequinones. See also Hypericin-like perylenequinones
multiple hydrogen atom transfers in, 15–19
Phantom states, thiophosgene molecules, second singlet excited state (S2), 73–76
Phenanthrenequinones:
DYLUX 503 development and, 163
visible light and, 160, 162
Phenidone, development and patents for, 221–222
Phosphorescence emission, thiophosgene molecules:
absence of, 77
first triplet electronic state (T1), 53–56
Photochemical research, color-overlay film development and, 218–221
Photochromic sunglasses, HABI chemistry and, 144–145
Photodecoration:
Dylux technology and, 204–209
HABI chemistry and, 207–209
termination of, 218
Photoelastic modulator (PEM), thiophosgene molecules, second singlet excited state (S_2), 63–64

Photofix system, patents for, 195–196

Photogenerated protons, excited-state intramolecular H-atom transfer in hypericin-like perylene quinones, 2–7

Photohorizons technology, military application of, 199–200

Photoimaging, Ltd., Dylux technology and, 244–245

Photogenerated protons, excited-state intramolecular H-atom transfer in hypericin-like perylene quinones, 2–7

Photophysical properties, thiophosgene molecules, 64–76

first excited singlet state (S_1), 64–72

first triplet electronic state (T_1), 51–56

second excited singlet state (S_2), 72–76

Photopolymerization process:
• HABI chemistry and, 170–172, 255–256
• o-nitroaromatic photoinhibitor, 233
  xeroprinting and, 241–244

Photosensitive composition:
• coatings technology for, 193–197
  patents, 148, 194–196
  UPC development and, 211–212

Phototropic technology, HABI chemistry and, 137–138

Picosecond temporal resolution, thiophosgene molecules, second singlet excited state (S_2), 73–76

Planar conformation:
• thiophosgene molecule electronic states:
  carbon-sulfur double bonds, 32–34
  ground electronic state, 34–36

thiophosgene molecules:
• first excited singlet state (S_1 (n,π*)), 40–47
• second singlet excited state (S_2), 57–64

Platelet-activating factor formation, Paterno-Büchi reaction, furan derivatives, 100–103

Point-of-sales opportunities, for Dylux, 179

Polarization-dependent OODR spectra, thiophosgene molecules, second singlet excited state (S_2), 63–64

Polymeric HABIs, permanent color production, 145–151

Polymerization, HABI chemistry and, imaging speed and initiation of, 171–172

Portable copiers, Dylux technology and, 217–218

Porter, George, 158

Potential energy functions:
• hypericin ground state heterogeneity, 9–10

thiophosgene molecules:
• first excited singlet state (S_1 (n,π*)), 41–47
• first triplet electronic state (T_1), 52–56
• second singlet excited state (S_2), 56–64

Predissociation, thiophosgene electronic states, first excited singlet state (S_1 (n,π*)), 70–72

Printing industry, HABI chemistry applications in, 151

Project Apollo, Dylux technology and, 183

Proofing technologies:
• Dylux development and, 190–191
• HABI chemistry and, 168

Proofpaper:
• black Dylux 535 product, 234–237
  limits of Dylux technology for, 200–201
  properties of, 193–197

TCTM-HABI development and, 223–227

Thermal Dylux® proofpaper, 252–255

Proton-transfer species, hypericin and hypocrellin, 7–8

10-ps component, excited-state intramolecular H-atom transfer, hypericin and hypocrellin, 4–7

Publications. See also Literature sources

• photopolymerization systems, 239
• photopolymers in electrostatic imaging applications, 243–244
• on photosensitive and heat sensitive recording materials, 231–232
• watermarks technology, 252

Pump wavelength, hypericin transient absorption kinetics and, 13–15

Pyramidal conformation, thiophosgene molecules:
• first excited singlet state (S_1 (n,π*)), 41–47
• second singlet excited state (S_2), 57–64

Pyrrole, Paterno-Büchi reaction, 117–118
Quadratic terms, thiophosgene molecules, first excited singlet state (S1 (n,π*)), 44–47
Quantum beat-modulated fluorescence decay, thiophosgene molecules: electronic states, 77
first excited singlet state (S1 (n,π*)), 67–72
Quantum mechanical calculations:
hypericin ground state heterogeneity, 9–10
multiple hydrogen-atom transfers in perylene quinones, 17–19
Quenching properties, Paterno-Büchi reaction, non-furan compounds, 122–123
Radiationless transitions, thiophosgene molecules, first excited singlet state (S1 (n,π*)), 64–72
Radiation physics, HABI chemistry and, 157–163
Raman spectroscopy, thiophosgene electronic states, ground electronic states, 36
Reactivity studies, Paterno-Büchi reaction, non-furan compounds, 122–123
Recording materials, Dylux technology for, 231–232
Regioselectivity, Paterno-Büchi reaction:
asymmetric furan reactions, 112–116
benzofuran, 92–93
furan compounds, 84–92
Restricted Hartree-Fock (RHF) theory, hypericin ground state heterogeneity, 9–10
Riehm, Roland (Dr.), 158
Ring-opening reactions, Paterno-Büchi reaction, furan derivatives, 97–103
Rotational analysis, thiophosgene molecules, first excited singlet state (S1 (n,π*)), 45–47
Rydberg states, thiophosgene molecules, first excited singlet state (S1 (n,π*)), 39–47
Scharf’s hypothesis, Paterno-Büchi reaction, furan compounds, 92
Schulz, D. (Dr.), 196–197
Second singlet excited state (S2), thiophosgene molecules, 56–64
Herzberg notation, 31–34
photophysical properties, 72–76
spin sublevel transitions, 78
Selection rules, thiophosgene molecules, 29
first excited singlet state, electronic matrix elements, 65–72
first triplet electronic state (T1), 47–56
second singlet excited state (S2), 60–64
Selenophene, Paterno-Büchi reaction, 118–119
Seminumerical Hessian calculations, hypericin ground state heterogeneity, 9–10
Sern-Volmer plot, Paterno-Büchi reaction, non-furan compounds, 122–123
Signaigo, Frank (Dr.), 151
Silversmith, Ernest (Dr.), 139, 160
Silyl furan derivatives, Paterno-Büchi reaction, 86–92
Singlet-triplet transitions, thiophosgene molecules, first triplet electronic state (T1), 47–56
Sinnott, Richard, 185–186
Skeletal coordinates, hydrogen atom translocation, 21–22
Society of Photographic Engineers and Scientists (SPSE):
Dylux presentations to, 191–192
Tokyo meeting of (1977), 230–232
Spectrographic analysis, thiophosgene molecules, first excited singlet state (S1 (n,π*)), 43–47
Spectroscopy, HABI chemistry and, 155–157
Spin-orbit coupling (SOC), Paterno-Büchi reaction, furan derivatives, 86–92
Spin-orbit operator, thiophosgene molecules:
first triplet electronic state (T1), 47–56
second singlet excited state (S2), 61–64
Spirit duplication, history of, 147–148
Stannyl furan derivatives, Paterno-Büchi reaction, 86–92
synthetic applications, 101–103
Statistical analysis, in HABI chemistry, 259–260
Statistical limit of radiationless transitions, thiophosgene molecules, first excited singlet state (S1 (n,π*)), 64–72
Stereochemical behavior, Paterno-Büchi reaction:
asymmetric reactions, 107–116
furan compounds, 91–92
Stereoselectivity, Paterno-Büchi reaction, asymmetric furan reactions, 111–116
Stick spectra, thiophosgene molecules, first excited singlet state (S1 (n,π*)), 43–47
Stimulated emission pumping (SEP), thiophosgene electronic states:
ground electronic state, 36
second singlet excited state (S2), 75–76
Strilko, Peter (Dr.), 159, 164
Symmetry axes:
thiophosgene electronic states, 29–34
first excited singlet state \((S_1 (n,\pi^*))\), 38–47
Synthetic applications, Paternò-Büchi reaction, furan derivatives, 96–103
Tautomeric forms, of hypericin and hypocrellin, 7–8
TCM-HABI, photopolymerization and, 256
TCTM-HABI:
Black Dylux 535 product and, 235–237
development and patenting of, 223–227
Terss, Robert, 172–173
Tertiary amines, photopolymerizable compositions and elements, 171–172
Tetracyanoethylene (TCNE), HABI chemistry and, 208–209
Thermal Dylux\textsuperscript{®} proofpaper, 252–255
Thiazole, Paternò-Büchi reaction, 120
Thin-film polarizer (TFP), hypericin ground state heterogeneity analysis, 11–15
Thiophene, Paternò-Büchi reaction, 116–117
Thiophosgene:
  basic properties, 28–29
electronic states, 29–64
  first excited singlet state \((S_1 (n,\pi^*))\), 36–47
  first triplet electronic state \((T_1)\), 47–56
  ground electronic state \((S_0)\), 34–36
