Chapter 1

Anatomy

Amy D’Andrea and Jessica Sjogren with illustrations by Nathan Davis

Introduction  3
Systems Overviews  4

INTRODUCTION

In relation to large animal species, anatomy plays an integral role in how the body works. As technicians, we should be familiar with how the body is put together and the vital functions of each structure. There are nine basic animal systems that we study: the integumentary system, the musculoskeletal system, the cardiovascular system, the lymphatic system, the respiratory system, the digestive system, the nervous system, and the genitourinary system.

This chapter will give a basic overview of each system and the specific anatomical structures that are important to recognize in various large animal species (Table 1.1). In addition, this chapter includes a detailed description of equine conformation and its relation to structural abnormalities.
### System Name / Anatomical Structures / Functions

<table>
<thead>
<tr>
<th>System Name</th>
<th>Anatomical Structures</th>
<th>Functions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integumentary</td>
<td>• Epidermis&lt;br&gt;• Dermis&lt;br&gt;• Hypodermis or subcutaneous layer&lt;br&gt;• Hair&lt;br&gt;• Glands of the skin&lt;br&gt;• Claws/dewclaws&lt;br&gt;• Hooves&lt;br&gt;• Horns</td>
<td>• One of the largest and most extensive organ systems in the body&lt;br&gt;• Composed of 4 tissue types&lt;br&gt;• Covers and protects underlying structures within the body&lt;br&gt;• A critical barrier to the harsh outer world</td>
</tr>
<tr>
<td>Musculoskeletal</td>
<td>• Bone&lt;br&gt;• Axial skeleton&lt;br&gt;• Appendicular skeleton&lt;br&gt;• Joints&lt;br&gt;• Skeletal muscle&lt;br&gt;• Cardiac muscle&lt;br&gt;• Smooth muscle&lt;br&gt;• Tendons</td>
<td>• The framework of the body that supports and protects soft tissues within the body&lt;br&gt;• Provides movement and some body functions</td>
</tr>
<tr>
<td>Cardiovascular</td>
<td>• Heart&lt;br&gt;• Blood&lt;br&gt;• Arteries&lt;br&gt;• Veins&lt;br&gt;• Capillaries</td>
<td>• Regulates body functions and delivers oxygen, antibodies, inflammatory cells, and nutrients throughout the body&lt;br&gt;• Removes waste from tissues&lt;br&gt;• The heart pumps blood throughout the vessels to maintain body function.</td>
</tr>
<tr>
<td>Lymphatic</td>
<td>• Plasma&lt;br&gt;• Red blood cells&lt;br&gt;• Platelets&lt;br&gt;• White blood cells&lt;br&gt;• Lymphatic fluid&lt;br&gt;• Immune components</td>
<td>• Transport system&lt;br&gt;• Cellular metabolism&lt;br&gt;• Assists in immune response&lt;br&gt;• Aids in homeostasis</td>
</tr>
<tr>
<td>Respiratory</td>
<td>• Upper respiratory tract&lt;br&gt;• Lower respiratory tract&lt;br&gt;• Lungs&lt;br&gt;• Thorax</td>
<td>• Responsible for the complex process of respiration and gas exchange within the body&lt;br&gt;• Brings oxygen into the body and carries carbon dioxide out</td>
</tr>
</tbody>
</table>

<th>System Name</th>
<th>Anatomical Structures</th>
<th>Functions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digestive</td>
<td>• Oral cavity&lt;br&gt;• Esophagus&lt;br&gt;• Stomach (monogastric/ruminant)&lt;br&gt;• Small intestine&lt;br&gt;• Cecum (horses)&lt;br&gt;• Large intestine&lt;br&gt;• Rectum and anus</td>
<td>• Breaks down complex foods, such as hay and concentrates, into nutrient molecules and absorbs the nutrients into the bloodstream for the body’s use</td>
</tr>
<tr>
<td>Nervous</td>
<td>• Neurons&lt;br&gt;• Central nervous system&lt;br&gt;• Peripheral nervous system&lt;br&gt;• Brain&lt;br&gt;• Spinal cord</td>
<td>• A complex communication system that monitors the body’s internal and external environments and directs the activities of the body</td>
</tr>
<tr>
<td>Genitourinary</td>
<td>• Kidneys&lt;br&gt;• Ureters&lt;br&gt;• Bladder&lt;br&gt;• Urethra&lt;br&gt;• Testes&lt;br&gt;• Penis&lt;br&gt;• Ovaries&lt;br&gt;• Uterus&lt;br&gt;• Cervix&lt;br&gt;• Vagina&lt;br&gt;• Vulva</td>
<td>• There are multiple, combined functions of this system that include filtering of waste products from the body and eliminating them in various ways, as well as reproduction.</td>
</tr>

Many physiological functions in horses are influenced by body condition, including heart's maintenance, reproductive and exercising requirements. A system called Body Condition Scoring can be used to rate ideal body condition. This condition scoring system is based on visual appraisal and palpable fat cover on six areas of the horse's body.

**Description of Individual Condition Scores (Score 1-9)**

4. **Moderately Thin:** Slight skin and fat covering on bone. Spines prominent. Transverse processes not well defined. Fat on hocks and flanks present. Abdomen, shoulders, and neck structure highly visible.

5. **Moderate:** Back fat present on edges. Ribs not causing difficulty. Fat present around tail, beginning on sirens. Abdomen, shoulders, and neck structure highly visible.

6. **Moderately Fleshy:** Ribs present but fat present on back, fat on tail, fat on abdomen. Fat present around neck. Fat present on hocks. Abdomen, shoulders, and neck structure highly visible.

7. **Fleshy:** May have a slight crest on back, individual ribs can be felt, but not noticeable. Fat present on back, fat on abdomen, fat present on hocks. Abdomen, shoulders, and neck structure highly visible.

8. **Fat:** Crest present on back. Individual ribs can be felt, but not noticeable. Fat present on back, fat on abdomen, fat present on hocks. Abdomen, shoulders, and neck structure highly visible.

9. **Extremely Fat:** Crest is present on back, partially fat covering over ribs, fat present on abdomen. Fat present on hocks. Abdomen, shoulders, and neck structure highly visible.
