CHAPTER 1
GOAL SETTING

WHAT IT’S ALL ABOUT

► The big problem in project management
► The magic line – what to say when you get handed a project and what not to say
► Setting a clear goal.
► Controlling changes to the goal
► Maximising the win-conditions of the stakeholders
► The definition of a successful project
► The way to set SMART goals
► When to consider something a project
Why is it that so many projects that we see, read about or get involved in, go wrong? In my experience, the number one reason for this is that they were never actually possible in the first place. You see, project management is actually the most difficult job in the world. This is because in project management, we get asked to make a prediction of the future (a plan) and then make the prediction come true (execute the plan). If you could actually do that each time, you probably wouldn’t be reading this book. Indeed I probably wouldn’t have written it. Instead I’d be spending my time at the race track or in casinos or buying lottery tickets – if I could predict the future and have it come true.

If that wasn’t bad enough, we often get asked to make these predictions in a very strange way. Imagine if your car was acting up. You take it to the garage and say: ‘I don’t know what’s wrong with my car, but I need you to fix it in the next half hour and I’ll give you fifty pounds/euros/dollars for it.’ It would be a strange thing to say. But imagine the mechanic in the garage simply responded with ‘sure’. That would surely be much stranger. And half an hour later, as you drive your car out of the forecourt having given him the fifty pounds, you’d be wondering what he’d done to your car and whether he had, in fact, done anything. Of course, we couldn’t imagine such a silly scenario in a garage.
However, in a lot of the projects that we get handed, such conversations are almost routine. Somebody says, ‘Here’s the project. I don’t know much about it. But it’s got to be done by this date for this budget. You can’t hire any more people and good luck with that.’

It’s important to realise that when you’re given a project, you’re actually given two things. There is the project itself, for example the 2012 Olympic Games, and then there are the constraints. Constraints are things like:

- it has to be done by a certain date;
- or within a certain budget;
- or with certain resources;
- or the scope of the project has already been decided;
- or some combination of these.

If you try to deal with the project and the constraints together, you’re potentially going to get yourself into a lot of trouble. Because as you think about the project, you think about all the stuff you’re going to have to do and all the time that’s going to take. But the constraints are telling you that you’re not going to be given that time. And you’re probably thinking that you are going to need four, five, possibly six people to do this project. Other constraints are telling you that you’ll lucky to get a man and a dog to work on it.

This book will talk about the reasons why projects fail. As I’ve already said, the number one reason that they fail is
that they were never actually possible in the first place. Somebody said, ‘Here’s the project and here are the constraints’ and everybody said, ‘Sure’. So the first thing you need to know when you get handed a project is the Magic Line.

THE MAGIC LINE

When somebody hands you a project, the last thing on earth you should say is ‘sure’. Instead you need to say, ‘I’ll take a look at it.’ Somebody comes running in to you and says here it is and they need an answer right now. You say, ‘I’ll take a look at it’. Somebody’s at a meeting, jumping up and down, banging the table and saying, ‘I need to know now’. You say, ‘I’ll take a look at it. Let’s take a time out so that I can do that.’ Somebody says, ‘The greatest of all bosses needs an answer by four o’clock today.’ You say, ‘I’m going to have to take a look at it.’

It’s the only reasonable and sensible answer when you’re given a project.

And in a million other normal trades, industries and professions, this is exactly what happens. Because when you do take your car to the garage and say, ‘I don’t know what’s wrong with my car …’, they don’t say ‘sure’. They say, ‘I’ll take a look at it.’ And the guy does exactly that. He lifts the bonnet or pokes around under the car and
then tells you what’s possible and what’s not possible. You may be waving your 50 euros but if they say to you, ‘Listen mate, you’ve got three choices. You can get a reconditioned engine, you can get a new engine, or you can go and talk to sales about a new car’, then you have some decisions to make.

This idea of an examination first to bring up the options, followed by a plan of action is standard in most normal trades, industries and professions. It’s the right thing to do. It’s also the right thing to do on projects.

WHO SAID IT

“If one does not know to which port one is sailing, no wind is favourable.”
– Seneca

Once you’ve said, ‘I’ll take a look at it’, it means that you can park the constraints while you try to understand what the project is all about. The first thing you have to do then is to figure out the goal of the project. There’s
nothing too surprising about that. There are three issues that you must address here and they’re all big project killers if you don’t get them right.

### 1. THE GOAL OF THE PROJECT MUST BE CLEAR AND NOT VAGUE

You must put a sort of boundary around the project. You then clarify that the things within the boundary are part of the project while the things outside the boundary are not. You may have heard of ‘in scope’ (within the boundary) and ‘out of scope’ (outside the boundary).

So:

- **In scope:** The project will do these things. It will bring these benefits. It will have these features. It will deliver these deliverables.
- **Out of scope:** The project will *not* do these things. They are parts of other projects or initiatives or systems. They’re not part of your thing.

If you succeed in fixing this boundary, think of it like this – a box:
If you fail to fix this boundary then it would be drawn like this – a cloud:

The problem with projects whose goal is ‘cloudy’ is that they can’t finish. They can’t finish because they don’t know what ‘finish’ is. With the clear (boxed) goal, it’s almost like the items within the box form a checklist. When all of these things are done, then the project is done. With the cloud we can’t say that and then what will happen is the following.

This is what the team will deliver:

But the boss will say, ‘This is what I was expecting.’
And the customer will say, ‘I thought we were getting this.’

And the resulting gaps in expectations will cause a lot of unhappiness to a lot of people.

We don’t have to look too far to find projects where this has been a problem. There was the movie Waterworld which had an initial budget of $100 million and ended up costing twice that. This was a film where they were rewriting the script (the definition of the goal of the project) while they were shooting the film. Or take the London Stock Exchange’s (in)famous TAURUS project which has become a classic case study in project failure.

TAURUS (Transfer and Automated Registration of Uncertificated Stock) was an IT project at the LSE designed to result in paperless trading and computerised shareholding. The main aim of Taurus was to reduce costs and the time taken to process share transactions. The project was started in the mid 1980’s and was finally scrapped in 1993 at a cost of about £800 million. The main reason for its failure was that the scope (goal) of the project was never fixed and so continued to expand over the life of the project.
After the project was cancelled and the recriminations began, one simple statement – from amongst a plethora issued by the Stock Exchange – told the story. ‘We were testing parts of the system, while other parts hadn’t been designed or built’ [my italics]. A cloudy goal? You said it.

So, your goal has to be clear, not vague. We have to have boxes, not clouds.

2. YOU MUST CONTROL CHANGES TO THE GOAL

Let’s say you succeed in boxing off your goal and then you start the project. What happens then? Well, what happens then is that changes start happening. Here’s something they should have told you about but they didn’t. Here’s something you should have seen but you missed it. Here’s a change in say, the business or the regulatory climate – something, for example, that your competitors have done that you’re going to have to respond to.

And there’s no problem with any of this – after all, the rate of change in the 21st century has become a cliché so we’re going to have to get used to this – provided you control the changes that occur. You can’t let them happen in an uncontrolled sort of way.
Because here’s the next big mistake that project managers make. They assume that because they’ve committed to a plan/budget/schedule/deadline/resourcing for a certain project scope, i.e. a certain set of things in the box, these must remain unchanged even if scope changes. Here’s a simple example to show that this is ridiculous.

Let’s say that the project you’re asked to do is to ‘make a container for water’. After some discussions with the customer, you understand that what they want is a glass – cylindrical, made of glass, a certain height, diameter, etc. Okay, you start the project. Now it turns out, once the project gets rolling that that wasn’t really what the customer wanted. They wanted a jug. A jug is also a container for water. But it’s a more complicated piece of engineering than a glass. The plan/budget/schedule/deadline/resourcing to make a jug is not the plan/budget/schedule/deadline/resourcing to make a glass. And if you’re not convinced of that, a swimming pool is also a container for water. The plan for a glass is not the plan for a swimming pool! But many project managers fall into the trap of thinking that since they committed to certain targets for the glass, they must deliver the swimming pool to the same targets. If you think of the glass and the swimming pool you can see how ridiculous this is.

So then we have to ask the question, ‘How could project managers be so stupid?’ ‘How could usually intelligent and educated people do something so dumb?’ The answer lies in the expression, ‘the customer is always
right’. And yes, the customer is always right. The people for whom we’re doing the project can change their minds in any way they want. But every time they change their minds, there’s a price associated with that. There’s a price in terms of time, money, resources – and controlling the changes means that we tell them the price. Some prices may be trivial – maybe they want the glass two millimetres wider in diameter and we can say, ‘yep, no problem.’ But some prices aren’t trivial. The price of ‘we don’t want a glass, we want a swimming pool’ is not trivial. We have to tell them the change in price.

So when changes occur on the project, as they invariably will, you have to know what to do. You’ll be able to deal with some changes yourself, without bothering the people for whom you’re doing the project. But for some changes you’ll absolutely have to go back to these people. You need to make the right choices here. You need to know when to do one and when to do the other.

**CHANGE CONTROL – ANOTHER WAY TO LOOK AT IT**

If a change occurs on your project – it can be a small change like ‘Charlie’s gone sick for the day’ or a big change like ‘we don’t want a glass, we want a swimming pool’.
pool’ – then there are three (and only three) ways you can deal with that change:

**Big change**

The first is you can say that this is a big change. The fancy term is a ‘change to the project’s terms of reference’ or a ‘change control event’. Some changes are like that, where what we are now being asked to do is significantly different from what we were originally doing.

**Use contingency**

Now, of course, lots of changes are not big changes. They’re little slip-ups. Because Charlie does go sick for the day, the server goes down, a supplier lets us down, or something simple turns out to be complicated – the thousand little things that are sent to try us. For these we need to have contingency in the plan. It’s perhaps worth remembering the following. Think of it as the Project Manager’s Prayer. It goes like this:

‘Unexpected stuff happens on projects. Most of it is **bad** unexpected stuff. Sometimes I get a lucky break, But mostly, it is bad unexpected stuff. For this I need to have contingency in the plan.’

You do! You need to have contingency in your plan.
‘Suck it up’

Finally then, if something is a big change, you might not have the guts to say that to the people for whom you’re doing the project. And if there’s no contingency in the plan, either because you never put it in, or you did, but then some genius took it out, then there’s only one other possible way of dealing with changes. To put it bluntly – that is to suck it up! Suck it up means work nights, work weekends, bring work home with you, tell your significant others that you won’t be home tonight or you can’t take your holidays during the project and so on.

Let’s be clear. There is nothing intrinsically wrong with sucking it up. If you accept the basic idea that project management is about predicting the future, then there may be times when you do have to suck it up – to hit a deadline, meet a milestone, solve a customer problem. No problem with that. But if sucking it up is the only thing you do when changes occur then that’s a huge problem.

On a healthy project there may be times when you shout, ‘Big change!’, there may be times when you have to use your contingency, and then there may be times when you have to suck it up. No problem with that. That’s a healthy project. An unhealthy project is where every change is dealt with by sucking it up. Most of us have experienced such projects. They’re not fun.
3. YOU MUST MAXIMISE THE WIN-CONDITIONS OF THE STAKEHOLDERS

You’ve boxed off your goal. You now know that you must control changes, i.e. make the right choice from the three possibilities when changes occur. The third and final thing you must do when goal setting is to maximise the win-conditions of the stakeholders. It may sound like a terrible piece of management waffle, but it’s actually a useful phrase.

The stakeholders are the people with a stake in the project. More specifically, they are the individuals or groups of people affected by the project. Individuals can be stakeholders – Fergus is a stakeholder, for example or Ellen is a stakeholder – or a group of people can be a
stakeholder. For example, all of your organisation’s customers could be a stakeholder or the body that regulates your industry could be a stakeholder. Generally speaking, some stakeholders are more important than others. You might, for example, see your boss as being a more important stakeholder than a supplier.

We tend to think of the obvious stakeholders – me, my team, my boss, the customer. But if we throw the net a bit wider, think a bit more carefully, we can come up with other stakeholders. There may be people in other departments of our organisation or people in other organisations. The test is – are they affected by the project? If they are in any way, whether positively or negatively, then they are a stakeholder in the project.

One particular stakeholder that you may come across is the one known as the ‘project sponsor’ – a term that is particularly popular in the UK. The project sponsor is generally a fairly senior person in the organisation who (a) sees a need for the project and (b) is responsible to the business for the success of it. In almost all cases, the project sponsor is not the project manager.

Also it’s worth mentioning that there is no correlation between the size of the project and the number of stakeholders. Small projects can have a large number of stakeholders or vice versa. It just varies.

Each stakeholder then, has win-conditions. Win-conditions are what that particular stakeholder would
regard as a successful outcome to the project. In general, different stakeholders have different win-conditions. Often win-conditions can be pulling in opposite directions. For example, if I’m the boss who has given the troops the impossible deadline, then maybe one of my win-conditions is that the troops hit the deadline. If, on the other hand, I’m a team member who has been working burnout hours for the last twelve months, then maybe my win-condition is that I just want to work a forty-hour week. Also since some stakeholders are more important than others, we will tend to treat some win-conditions as being more important than others.

Finally then, maximising the win-conditions of the stakeholders means, given that we have all these different win-conditions, being able to come up with a combined or composite set of win-conditions that will keep everybody happy. This is what leads to a successful project.

**The Definition of a Successful Project?**

So what’s a successful project? Quite simply, a successful project is one that results in happy stakeholders. You tell the stakeholders what they’re going to get from the project and that’s what they get. When you put it like that it sounds pretty simple. When you put it as ‘predict the future and have it come true’, you see what a tall order it really is.
But this is what the stakeholders want. So obviously then, if you want to deliver happy stakeholders, the first question is, ‘What’s going to make them happy?’ You have to find out. And how do you do that? Go and ask them. Don’t assume that you know. Or, by all means, take a shot at it yourself first, but then go and confirm it with them. And get them to sign something or confirm in writing.

This is goal setting. It’s the single most important thing you’ll do in your project. Finding out who the people affected by the project are, and what they hope to get from it is essential if you’re to have any chance of your project succeeding.

**SMART GOALS**

Here’s another useful thing to bear in mind when you’re identifying the goal of your project. You need to think in terms of your goal being SMART:

- **Specific** – The goal is precise, not vague. ‘Learn a musical instrument’ is vague, ‘learn to play the guitar’ is precise.
- **Measurable** – A goal can be measured whether it has been achieved or not. The goal, ‘learn to play the guitar’ cannot really be measured; the goal ‘have played my first gig before a live audience and be paid for it’ can.
Achievable – The goal is attainable as opposed to some pie-in-the-sky nonsense. If the goal you had set yourself was, for example, ‘to practice the guitar three hours a day, every day’ but you had a full-time job, a family and were renovating a house, then this goal is probably not achievable. The goal, ‘practice an hour each evening’ might be.

Realistic – The goal actually makes sense. The goal ‘become as a good a guitar player as John Williams in one year’ makes no sense; ‘play a gig in front of an audience within one year’ (maybe) does.

Time-bound – The goal has a timeframe – essentially a deadline. The goal, ‘play a gig in front of an audience’ is not time-bound; the goal ‘play a gig in front of an audience within one year’ is.

WHO SAID IT

“Those last few seconds seemed never-ending. The faint line of the finishing tape stood ahead as a haven of peace, after the struggle … If I faltered, there would be no arms to hold me and the world would be a cold, forbidding place.”

– Roger Bannister
GOAL SETTING GIVES YOU THE MOTIVATION TO DO THE PROJECT

In some ways, the most important thing about goal setting is that it provides you with the motivation to get the project done. You paint the picture of what life will be like when the project is over. As it becomes clearer in your mind, the sense of how you will feel when the project is done, begins to take root. If you can communicate this to your team it becomes the motivation that takes all of you forward. There will almost invariably be tough times ahead. The picture of the goal – the ‘vision’, if you like – will help to sustain you during those dark days.

WHEN TO CONSIDER SOMETHING A PROJECT

The final question to ask when it comes to goal setting is when does it apply? Or another way of asking the question is, how big does something have to be before you should treat it as a project?

If you’ve ever had the experience of somebody saying, ‘this shouldn’t take you very long’, or ‘would you mind doing this quick thing?’ – and two years later you’re still working on it because it turned out to be bigger than the Aswan Dam, then you should consider doing this on every request that comes your way.
Say, ‘I’ll take a look at it’ and then go figure out the goal of the project, which is described shortly in the *How You Need To Do It* section. Then, if it is truly a small thing, great. More often than not though, you’ll have found complications that you would have missed had you not done the simple goal setting that we’re going to describe. You’ll also have saved yourself some very deep pain, which, you have to agree, is a very good thing indeed.

**WHO YOU NEED TO KNOW**

*The World’s First Project Manager*

The truth is that we don’t know. The man (or woman) who project managed the Great Pyramid, is a contender. Built around 2560 BC, it is still a matter of conjecture how the large square stones of which it is made were lifted into place. But then you’ve got something like Stonehenge which – it is believed – was built six hundred years earlier, around 3100 BC.
The world’s first project manager was probably one of our caveman ancestors who, one day with his colleagues, decided that with winter coming they needed to go and bag themselves a woolly mammoth. (We’re talking somewhere around 150,000 years ago.) Sitting around the fire one evening they built their plan. The project manager had gathered the team together. (Always a good move – involve the team in the planning.) They would have to have weapons, they decided – clubs, spears, that kind of thing. And then having found the woolly mammoth, some of them would have to drive it towards where the rest of them would be waiting to kill it – maybe in some kind of canyon or dead end. Or they could dig a hole, somebody suggested. Cover it with leaves and sticks and have the woolly mammoth fall in. Good stuff – evaluate alternative ways the project could be done. Finally, perhaps they settled on the hole-with-sticks-and-leaves option.
Next morning they headed off, located a herd of woolly mammoth, found a suitable spot nearby and dug their hole. The hole was duly disguised and they went off to drive the mammoth towards the trap. A mammoth obligingly fell in and they killed it with their spears and clubs. Ah, but then a problem. In fact, two problems. How do we get nine tons of mammoth out of the hole? And how do we get that much meat, fur and bones back to the cave?

And so the world’s first project cock-up took place: Failing to specify the correct goal of the project – in this case, ‘get a supply of food for the winter’ rather than ‘kill the woolly mammoth’ – continues to be one of the world’s biggest project killers.
HOW YOU NEED TO DO IT

Establishing the Goal of Your Project

To establish the goal of your project, do the following:

1. Say ‘I’ll take a look at it.’
2. Park the constraints.
3. Answer the question ‘how will I know when this project is over?’ What point in time marks the end of this project? What is the final event that marks its conclusion? This will tell you the goal of the project.
4. Make a list of all the stakeholders. For each stakeholder, write down their ‘win conditions’ i.e. write down what they would regard as a successful project.
5. Some organisations have documents that they use to initiate projects. Two of the most common names for these documents are ‘Project Charter’ or ‘Project Initiation Document’. Doing these steps will give you all the essential information you need to write one of these documents.
Example

Imagine your boss asks you to ‘run a job advertisement’ for a particular kind of person. She says it needs to be done by the end of the month [constraint].

When is this project over? Not the trivial question it might first appear. Often project goals are phrased very loosely. Is this project over when the advert runs in the paper, or when you get CVs in response to the ad, or when you interview some people, or when you hire somebody or what? All these are potentially valid endings to this project. You need to clarify this with your boss. Say it turns out to be just running the ad.

So the stakeholders and their win conditions would be defined as:

<table>
<thead>
<tr>
<th>Stakeholder</th>
<th>Win conditions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Us</td>
<td>Run ad that reflects well on the company and doesn’t upset anybody. It also should communicate why the jobs on offer are so attractive that you’d want to be mad not to apply.</td>
</tr>
<tr>
<td>Our boss</td>
<td>The ad sends out a positive message about the company.</td>
</tr>
<tr>
<td>Stakeholder</td>
<td>Win conditions</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Existing employees</td>
<td>Doesn’t upset anybody – uses only material that is in the public domain. Sends out a message that the company is one that people want to work for.</td>
</tr>
<tr>
<td>Potential employees</td>
<td>Sends out a message that the company is one that people want to work for.</td>
</tr>
<tr>
<td>Our customers</td>
<td>Sends out a message that the company is expanding, and is a good company to do business with.</td>
</tr>
</tbody>
</table>

So now you know all the key information about this project. You know who the stakeholders are, what’s going to make them happy, what lies within the scope of the project and what will be regarded as the end of the project.
WHO SAID IT

“If you don’t know where you’re going, you’ll wind up somewhere else.”
– Lawrence Peter ‘Yogi’ Berra

WHAT YOU NEED TO READ

The Project Management Institute or PMI (www.pmi.org) is the number one organisation in the world for people involved in project management. The website offers templates for Project Charters and Project Initiation Documents in the Practical Guide to Project Documentation.

The Association for Project Management, or APM (www.apm.org.uk) is a UK-based organisation whose mission is ‘to develop and promote the professional disciplines of project and programme management for the public benefit’.
The Mythical Man Month and Other Essays on Software Engineering by Frederick P. Brookes (Addison Wesley, 1995) is one of the classics of project management. Although it was written more than 20 years ago, many of the lessons in it are as valid now as they were then.

As a novel, The Deadline: A Novel About Project Management by Tom DeMarco (Dorset House Publishing, 1997) is terrible. As a text on project management, it gives powerful lessons and insights.

Scott and Amundsen: Last Place on Earth by Roland Huntford (Abacus, 2000) might sound like a strange choice, but even if you’re not interested in travel or exploration, get your hands on it anyway. It’s not often that we get to see the same project done by two different teams, with two spectacularly different outcomes.

IF YOU ONLY REMEMBER ONE THING

The only sensible answer when somebody hands you a project and a deadline is to say, ‘I’ll take a look at it.’
