Index

Accelerated failure time (AFT) model, 411–13
Accelerated hazards
   AFT model, 411–13
   bone marrow transplant, 412–13
   proportional hazards model, 411
   Weibull hazard, 412
Akaike information criterion (AIC), 36–7
ARCH model, 244–6
ARD prior. See Automatic relevance determination (ARD) prior
ARMA models. See Autoregressive and moving average (ARMA) models
Augmented data regression, 107–9
Automatic relevance determination (ARD) prior, 366
Autoregressive and moving average (ARMA) models
   Bayesian priors
      BUGS code, 218–19
      normal–gamma conjugate priors, 219
      outliers/shifts, 221
      Schur’s theorem, 218
      stationarity enforcement, 219–20
   dependent errors, 218
   distributed lag regression, 217
   estimation and forecasting, 216
   likelihood model, 216
   vector autoregressive models, 217
Bayesian evidence synthesis. See Meta-analysis
Bayesian information criterion (BIC), 36–7, 216, 403
Bayesian regression, 97
Bernoulli parameters, 111
Beta-binomial hierarchical model, 56, 59–61
Bias–variance trade-off, 35
BIC. See Bayesian information criterion (BIC)
Binary and binomial regression
   Cauchy priors, 103
   cross-validated (CV) predictive density, 104–5
   DAP prior, 103
   distribution function, 102
   evidence-based priors, 103
   latent outcome approach, 104
   link function, 102–3
   MCMC iteration, 104
   posterior density, 103
   predictive/discriminatory value, 104
   scaling nonbinary predictors, 103
Binary panel data
   employment transitions, 287–8
   latent continuous variables, 285–6
   logit link, 286
   MCMC sampling, 285
   permanent subject effects, 286–7
   probability of success, 286
   truncated normal sampling, 286
Bivariate meta-analysis, 67–9, 194–5
Box–Cox transform, 152, 154, 332
CESD depression index, 153
Conditional autoregressive (CAR) prior, 321–3
Conditional predictive ordinate (CPO) cross-validation, 47, 48
   leave-one-out posterior predictive distribution, 5
   outlier diagnostic, 24
   predictive density, 101
   pseudo Bayes factor, 25
Conditional prior models
   CAR prior, 321–2
   conditional expectations, 324
   ecological analysis
      averaged spatial effect, 325
      crime rates, English local authorities, 327–8
   FDR, 326–7
   INLA spatial estimation, 328–9
   marginal variance, 324
   maximum likelihood fixed effects, 324
   mixed regressive-convolution, 324
   overdispersion, 324
   spatial switching prior, 326
   Student-t distribution, 325
   ICAR prior, 322
   MCAR prior, 323
   MCMC computation, 321
   normal iid prior, 322

Continuous data, hierarchical smoothing methods
bivariate meta-analysis, 67–9
multivariate borrowing of strength, 65–6
priors on hyperparameters, 62–3
teacher expectancy and pupil IQ, 66–7
unit latent means, 61

Continuous time functions
bladder cancer, 411
cancer survival, 410–411
cumulative density, 403
deviance residuals, 405
Gompertz parametric model, 409
hazard and survival rates, 404
intensity function, 404–5
Martingale residual, 405
parametric hazard models, 405–7
Poisson mean, 405
semi-parametric hazards, 408–9
time density, 403

CPO. See Conditional predictive ordinate (CPO)

Cross-sectional normal structural equation models
(SEM)
ARD prior, 366
canonical structural equation model, 365
dependent and exogenous factors, 365
formative indicators, 365
measurement model, 365
spike-slab priors, 366–7
variance/covariance factor, 366

Cross-validation procedures
adaptive score data, 49
case-influence assessment, 48
discrepancy measures, 47
dSS, 50, 52
intrinsic Bayes factor, 49
Kullback–Leibler divergence, 48–9
omnibus criteria, 51
PIT, 47
posterior predictive distribution, 50, 51
posterior predictive sampling, 52
PsBF, 48
PsML, 48
ranked probability score, 50
reference distribution, 51
Cumulative incidence function, 424

Dawid-Sebastiani score (DSS), 50, 52
Differential item functioning (DIF), 382
Dirichlet process priors (DPP)
multinomial sampling, 73
random distribution, 72
stick-breaking prior, 74

Discrete mixture models
data likelihood stage, 69–71
English abortion rates, 74–5
Hepatitis B, Berlin regions, 76–8
hierarchical mixtures, 70
latent binary/multinomial indicator, 72
MCMC estimation, 71
normal–normal models, 70–71
Poisson–gamma models, 59

Discrete mixture regressions
concomitant variable modelling, 161
latent class Poisson regression mixture, 162
outlier accommodation, 163–5
viral infections, potato plants, 165–7

Discrete outcomes
benefit claims, 233–4
conjugate process parameters, 232–3
INAR models, 231–2
latent class models (see Latent class models)
latent trait models (see Latent trait models)
logit regression, 230, 231
overdispersed discrete outcomes (see
Overdispersed discrete outcomes)
onew own and cross category lags, 230
Poisson count data, 231
Poisson time series regression, 229
polio infections, USA, 234–5
unconditional mean and variance, 230

Discrete process convolution (DPC) approach
continuous white noise process, 332
discretized kernel smoother, 333
multivariate factor models, 333
ozone readings, 333–5
spatial framework interpolation, 335–7

Discrete time approximations
discrete distributions, 413
event variable, 414
hazard regressions, 415–17
interval hazard rate, 413
Kaplan–Meier method, 414–15

DPC approach. See Discrete process convolution
(DPC) approach

DSS. See Dawid-Sebastiani score (DSS)
Dynamic factor models
autoregressive dependence, 373
Bayesian dynamic factor models, 372
Canadian money measurement, 373–4
multivariate stochastic volatility, 372
structural model time dependence, 373

Dynamic linear and general linear models
Arctic sea ice, 241–2
autoregressive priors, 237
constant dispersion matrix, 238
trend variance and state variance, 238
first-order random walk prior, 239
Markov sequence, 236
MCMC sampling schemes, 239
non-linear Gaussian models, 238
non-linear latent series, 239–41
prior, predictive and posterior distributions, 236
state equation, 236
time varying regression coefficients, 237
TV advertising, 243–4

False discovery rate (FDR), 326–7
Formal Bayesian model assessment, 37–8
Fraility, 403
continuous longitudinal biomarker, 421–2
Dirichlet process and Polya tree priors, 418
institutional frailty effects, 418–21
longitudinal and survival components, 421
population hazard rate, 417
primary biliary cirrhosis, 422–3
randomly distributed multiplicative frailty, 418
shared trajectory model, 421
survivors proportion, 417

Gamma Markov process, 233
Gamma scale mixing, 150
GARCH model, 244–5, 247
Gaussian linear model, 330–331
Gelman–Rubin scale reduction factors, 20, 21
Geographically weighted regression (GWR), 338–9, 341–2
Gibbs sampling, 8–9, 71
Gibbs variable sampling (GVS) method, 111
Gompertz parametric model, 409
GWR. See Geographically weighted regression (GWR)

Hierarchical longitudinal models
autoregressive errors, 275–6
continuous data specification, 274
correlation, 275
dynamic linear models, 276
extended time dependence, 276–7
linear growth curve model, 274
random subject effects, 275
returns to education, 277–8
Histogram smoothing, 80–81, 83
Huber M-estimation technique, 150
Hyper-population smoothing, 34–5

Integer valued autoregressive (INAR) models, 231–2
Integrated nested Laplace approximations (INLA), 10–11
Intrinsic conditional autoregressive (ICAR) prior, 322, 324, 325, 327, 340, 378
Item response theory (IRT) model, 381

Jeffreys prior, 2–3

Kaplan–Meier method, 414–15
Kullback–Leibler divergence, 48–9
Kuo-Mallick prior, 117

Lasso prior methods, 116–17
Latent class models
beta priors, 383
corner constraint, 382
Dirichlet prior, 383
gold standard indicators, 383
independent variable, 382
psychiatric caseness, 383–5
Latent trait models
continuous variables, 382
DIF, 382
government services and interventions, 385–7
IRT model, 381
item response probability, 381

multilevel data, 387–9
probit and logit link, 381
Linear regression model
Browley’s coefficient of skewness, 100
chi-square discrepancy, 101
conditional predictive ordinate (CPO), 101
permanent income and consumption, 101–2
posterior predictive probability, 100
residual checking, 100
skew and kurtosis, 100–101
Linear structural equation models (SEMs)
edogenous and exogenous indicators, 374
identifiability constraints, 375
measurement model, 375
two wave data
baseline structural model, 376
covariance matrix, 375–6
grade lag effect, 377
measured indicators, 376
posterior means, 378
PPLC measure, 377
quantitative and verbal ability, 376
Link selection, 160–161
Logit-Poisson hurdle regression model, 158

Longitudinal discrete data
binary panel data
employment transitions, 287–8
latent continuous variables, 285–6
logit link, 286
MCMC sampling, 285
permanent subject effects, 286–7
probability of success, 286
truncated normal sampling, 286
ordinal panel data
cumulative density, 289
cumulative probabilities, 289
Markov transition approaches, 288
missing data modelling, 288
ordinal probit model, 289
ordinal scales, 288
schizophrenia ratings, 289–92

Mantel–Haenszel method, 185
MAR. See Missing at random (MAR)
Marginal likelihood estimation, 38–40, 122, 329
Matérn correlation function, 330
MCAR prior. See Multivariate conditional autoregressive (MCAR) prior
MCMC methodology. See Monte Carlo Markov chain (MCMC) methodology

Meta-analysis
binomial/Poisson likelihood, 186
canonical meta-analysis model, 185
dose–response curves, 184
hip arthroplasties, 190–191
input data, 184
inverse variance method, 185
lung cancer and environmental smoking, 192–3
Mantel–Haenszel method, 185
medical meta-analyses, 185
meta-regression, 187
multivariate meta-analysis, 193–5
Meta-analysis

- (continued)
  - predictive cross-validation, 191–2
  - publication bias, 187
  - random effects model, 185–6
  - scale mixture approach, 186
  - second stage variance ($\tau^2$), 188–9
  - smoking cessation treatments, 190

Meta-regression, 187

- Metropolis–Hastings algorithm, 112
  - candidate value, 7
  - Gibbs sampling, 8–9
  - $\kappa$ and $\sigma_q$ parameters, 8
  - logistic regression, 15–17, 19
  - updating schemes, 8

Missing at random (MAR), 298, 389

Model choice and checking. See Cross-validation procedures

Monte Carlo Markov chain (MCMC) methodology

- Bayes factor, 44–5
- BUGS software, 11–12, 26–8
- computation, 321
- convergence, 19–21
- fit measures, 36
- INLA approximations, 10–11
- iteration, 104
- JAGS software, 11–12
- label switching, 71
- marginal likelihood estimation, 38–40, 45–6

- Metropolis–Hastings algorithm
  - candidate value, 7
  - Gibbs sampling, 8–9
  - $\kappa$ and $\sigma_q$ parameters, 8
  - logistic regression, 15–17, 19
  - updating schemes, 8

model assessment
  - informal sensitivity analysis, 23–4
  - model choice, 25
  - posterior predictive checks, 24–5
  - model averaging, 42–4
  - model identifiability, 21–2
  - normal likelihood, 13–15
  - parallel sampling method, 45–6
  - penalised goodness of fit, 36–7
  - posterior density approximation, 40–42
  - R-INLA software, 11–12
  - RJMCMC algorithm, 9–10, 112
- sampling, 239, 280, 285
- sampling parameters, 6, 7

Mortality odd ratios, 5

Multilevel analysis

- cluster-specific regression estimates, 184
- correlated effects, 197
- crossed classification analysis, 198, 201
- discrete responses, 201–4
- fixed and zero-centred random effects, 196
- heteroscedasticity, 204–6
- multivariate indices, 206–8
- nested arrangement of data, 198
- normal linear multilevel model, 197
- normal linear two level model, 198, 199
- posterior predictive checks, 198
- pupil attainment, 201

pupil popularity, 199–201
random effects, 184
robust estimation, 199
statistical inferences, 183
univariate effects, 197
variance components form, 196

Multinomial–Dirichlet model, 233
Multinomial logit and probit models, 127–8, 131–2
Multivariate conditional autoregressive (MCAR) prior, 323
Multivariate meta-analysis, 193–5

Nelson–Plosser series, 224–6
Nested logit model, 128–30, 132–4
Non-linear Gaussian models, 238

Non-linear regression effects
  - fixed effects prior, 171
  - kyphosis data, spinal surgery, 172–5
  - motorcycle dataset, 171–2
  - random effects prior, 171
  - smoothness priors, 167–9
  - spline regression, 169–70

Normal–gamma conjugate priors, 219

Normal linear models
  - growth curves
    - autoregressive errors, 281
    - bivariate normal random effects, 280
    - hypertension trial, 281–4
    - iid measurement error, 281
    - Markov chain Monte Carlo sampling, 280
    - mixed model, 279–80
    - multivariate normal, 278
    - scale matrix, 279
    - subject level autoregressive parameters
      - autoregressive latent trait model, 283
      - log link regression, 284
      - $p$ lags growth model, 284
      - protein content, milk, 284–5
  - Normal linear regression model, 98–100, 112, 115, 151

Normal linear structural equation models (SEMs)
