prenatal disruptions, 202
amniotic band: sequence, 202
clinical relevance, 204–206
virus infection and maternal alcohol intake, 202
primary and permanent teeth, early formation and eruption,
terrelationship, 126

primary dentition, 111
dentin dysplasia, 86
disruption in
dentin dysplasia, 86
ghost teeth, 84, 86
histological sections of maxillary primary central incisors
from human fetuses, 86
macrodontic permanent maxillary central incisor, 88
orthopantomogram of child, received chemotherapy, 86
perinatal inflammation in nine years child, 86
postnatal operation, 84, 86
pulp calcification, 86
trauma, 81
virus attack, 81, 84
dysplasia in
dentinogenesis imperfecta, 87
ectodermal, 87
eruption problem, 142
malformation of incisors, canines, and molars
alveolus of primary incisor and canine, 83
changes in crown color, 81
in child with, congenital kidney disease, 85
fused, primary, maxillary central, and lateral incisors,
radiographic and intraoral image, 82
fused teeth, 81
fusion of mandibular incisors, 82
inexplicable discoloration of teeth, 84
narrow incisors and spacing in mandible, 84
narrow incisors, tooth agenesis, and tooth malformations
in, 84
and permanent molar, 101
root morphology, 81
single median maxillary central incisor (SMMCI), 81, 83
taurodontia in primary molars and in permanent molars, 85
types of fusions of primary incisors and canines, 82
trauma in maxillary primary central incisors, 85

primary eruption failure
bilateral, 140
primary/early mixed dentition
bilateral, 141
unilateral, 140
primary molar, 174
abnormal eruption pattern
dental film, 129
orthopantomogram, 129
arrested, 174
different degrees of retention, 127
nonsheding
inheritable factor
orthopantomogram, 142
radiograph, 142
primary retention, 174
primary teeth, 60, 61. see also primary dentition
pathological eruption, 125
abnormal times, 125
arrested eruption of single teeth, 125
total failure, 125
root, 56

R
regional dysplasia
mandible, 144
maxilla, 144
regional odontodysplasia, 144
resorption, in permanent dentition, 156
clinical relevance, 166
dentitions especially susceptible to root resorption, 156, 157
ectodermal deficiency, 157, 159
innervation deficiency, 157, 158
mesodermal deficiency, 157
resorption occur in normally developed individuals, 156
resorption, in primary dentition, 151
clinical relevance, 166
pattern of resorption, 151, 152
shedding times, 152
ever, 153
late shedding/nonshedding, 153–156
Rieger syndrome, 114
root anomaly, 51
long, 51
short, 51
root development, 48
rootless mandibular premolars, eruption, 141
root membrane, 48
root resorption, 160
disruptions, 160
dysplasia, 160
orthopantomogram, 161
and heredity, 158–160
bilateral, 160
orthopantomogram, 159
permanent dentition, prevention of, 160, 161
syndromes, 160 (See Down’s syndrome)

S
Schwann cells, 116
secondary arrested eruption
alveolar bone level
radiograph, 146
schematic drawing, 146
secondary retention, 175
segmental odontomaxillary/mandibular dysplasia, 139
sella turcica, 1, 5, 9, 10
malformation, 75, 76
empty sella, 75
with overlying bridge of bone tissue, 76
normal, morphology, 7
shape, 29
unrecognizable, with impressiones digitatae in cranium, 27
sequence, 77
eruption, primary and permanent dentition, 68–70
in prenatal tooth formation, 49
Sharpey’s fibers, 65
shedding, 50
single median maxillary central incisor (SMMCI), 77, 78, 81, 83, 88, 114
skeletal development, 1
skeleton, of a human fetus, 3
SMMCI. see solitary median maxillary central incisor (SMMCI)
syndrome
SMMLI. see solitary median maxillary lateral incisor (SMMLI)
solitary median maxillary central incisor (SMMCI)
syndrome, 111, 177–180, 220
absence of midpalatine suture in incisor region, 179
area affected in a holoprosencephalic fetus in brain (left) and in cranial base, 181
area of facial malformation related to skeletal malformations, 182
cephalometric drawing and a profile radiograph of a child with, 185
demonstration of extremely rare condition, 184
external view and brain morphology in a nonviable ethmocephalic human fetus, 182
facial appearances of human fetuses, 178
frontal, histological sections through nasal cavities of holoprosencephalic fetuses, 180
height and weight increment in a child with, 184
human fetus with cyclopia, 178
illustration of child with SMMCI combined with holoprosencephaly in mildest form, 182
intraoral photograph and three dental films of primary dentition in, 183
lip contours observed in condition with, 184
midsagittal, histological sections of cranial base through sella turcica, 180
palate from a cebocephalic human fetus, 178
palate from a midline cleft human fetus, 178
palate from an ethmocephalic human fetus, 178
permanent dentition in SMMCI observed intraorally and radiographically, 183
postnatal, 177–180
prenatal, 177
profile radiograph of a child with, 184
Index
