Contents

Preface ix
Introduction xi

1 The Foundation of Clinical Decisions 1
   The clinical decision process 2
   Clinical data 4
   Scales of measurement 7
   Taking the history 9
   The physical examination 11
   Paraclinical findings 12
   Global assessments 14

2 Reliability and Relevance of Clinical Data 17
   Clinical data on an interval scale 19
   Clinical data on an ordinal scale 22
   Clinical data on a binary scale 22
      Descriptive paraclinical findings 22
      Descriptive physical signs 26
   The statistical concept of normality 27
   The concept of disease 30
   Interpretation and relevance 33
      Indicators 35

3 The Disease Classification 37
   The historical perspective 38
      The seventeenth and eighteenth centuries 38
      The nineteenth and twentieth centuries 40
vi CONTENTS

The theoretical perspective 42
   The mechanical model of disease 42
   Molecular biology 43
   Disease and the environment 44
The practical perspective 46
   Name of disease 46
   Definition 47
   Causes of disease (aetiology and pathogenesis) 52
   The clinical picture 56
   Diagnosis and treatment 59

4 Diagnosis 61
   The diagnostic universe 62
   Diagnosis of diseases with an accessible defining criterion 65
      The direct method for assessing the accuracy of test results 65
      The indirect method for assessing the accuracy of test results 68
      Terminological confusion 72
      Quantitative data 74
   Diagnosis of diseases with a concealed defining criterion 77
   Syndrome diagnosis 80
   Three patients 84
   Diagnosis in practice 85
      Frequential and subjective probabilities 85
      Diagnostic strategy 87

5 Uncontrolled Experience 91
   Uncontrolled experience in a pre-scientific era 92
   The numerical method 94
   The era of laboratory research 96
   The spontaneous course of the disease 98
   Regression towards the mean 99
   Run of luck 101
   Bias 103
   The placebo effect 104
   The need for controlled experience 108
   Alternative medicine: pseudoscientific thinking 109
CONTENTS

6 The Randomized Clinical Trial 115
   Selection of patients 116
   Randomization 117
   Choice of treatment in the control group 119
   Principles of blinding 120
   Cross-over trials 122
   Measures of benefits and harms 123
      Stopping rules 126
      Assessment of the results 127
   Statistical analysis 129
      Hypothesis testing 129
      Estimation 133
      Other statistical measures of effect 135
      Subgroup analyses 136
   Systematic reviews 136
   From trials to practice 142
      Evidence-based medicine and commercial pressures 145

7 Medicine and the Humanities 149
   The four components of clinical reasoning 149
   The empathic-hermeneutic component 151
   The ethical component 153
      Three kinds of norms 154
   The foundation of health care ethics 155
      The structure of ethical reasoning 157
      Assessment of the facts of the case 159
      Consequential considerations 159
      Deontological considerations 160
      The ethical decision 161
   Quality of life 162
   Autonomy and paternalism 164
   Clinical examples 166
   Clinical research ethics 174

8 Critical Reading of Medical Journals 179
   Logical analysis of medical papers 179
      Assets and limitations of cohort studies 182
viii

CONTENTS

Assets and limitations of case-control studies 183
Other designs 186
Descriptive statistics 187
Estimation 190
Testing hypotheses 192
  Pseudohypothetico-deductive logic 193
  Wrong sampling unit 193
Sample size calculations 195
Interpretation of P-values 196
Statistical tests 199
Examples 200
Correlation analysis 202
Life table analysis 207
