AHP (analytic hierarchy process) (Saaty, T.L.)
75–87
about AHP 75–6
axioms of:
expectation axiom 84
homogeneity axiom 83–4
reciprocal axiom 83
synthesis axiom 84
AHP comparisons to SMART 84–7
criticisms of AHP
conversion from verbal to numeric scale 85
meaningfulness of responses to questions 86
new alternatives can reverse rank of those
existing 86–7
number of comparisons can be large 87
problems of 1–9 scale 85–6
relative strengths of AHP
redundancy allows checking of consistency 85
simplicity of pairwise comparisons 85
versatility 85
AHP using EXPERT CHOICE software 75–87
1. setting up the decision hierarchy 76
2. making pairwise comparisons of attributes
and alternatives 77–8
comparing preferences 78
tables for comparisons 77–8
use of verbal responses 77
3. transforming comparisons into weights and
checking consistency 78–80
converting tables to weights 78–9
inconsistency ratio 79–80
using EXPERT CHOICE software 79–80
4. use weights to obtain scores and make
decisions 80
5. perform sensitivity analysis 80–1
food processing company example 75–80
AHP using hand calculations 81–3
1. table preparation 81–2
2. calculating/checking the inconsistency ratio
82–3
Allais’s paradox 141–2
anchoring and adjustment heuristic 256–60
associated biases
insufficient adjustment 256–7
overconfidence 259–60
overestimating the probability of conjunctive
events 257–8
underestimating the probability
for disjunctive events 258
analytic hierarchy process see under AHP
approval voting (Ferrell, W.R.) 316
Arrow, K.J.
four conditions for group preferences 315–16

simulation runs 189–90
estimating probabilities from 190–1
reliability issues 191
stochastic dominance 199–203
first degree 199–200
from cdfs 199
second degree 200–3
simulation for investment decisions 207–13
Alpha and Beta investments example 207–13
applying the simulation 209–11
probability distributions 209–11
and modeling dependence relationships 212–13
net present value (NPV) method 207–13
utility and NPV 211–12
present value factor 207
single attribute utility 124–30
SMART (simple multi-attribute rating technique) 33–58
about SMART 33–4, 57–8
additive model 48
aggregating the benefits 48
analysis stages 35–6
assumptions when aggregating values 53–5
attributes, definition 34
attribute weights 44–7
axioms 52–3
decidability 52
finite upper and lower bounds for value 53
summation 53
transitivity 53
benefits/costs trading 48–50
intuition and analysis conflicts 55–7
objectives, Keeney/Raiffa definition 34
office location example 35–58
about the example 35
options performance measurements 39–44
direct rating 40–2
value functions 42–4
sensitivity analysis 51–2
scenario planning, stages in 424
value tree construction 36–9
value and utility, definition 34–5
see also AHP comparisons to SMART
SMART SWAPS 74
SMARTER (SMART Exploiting Ranks) 65–8
about SMARTER 65
differences from SMART 65–6, 67–8
rank-sum weights, Roberts/Goodwin
calculation method 68
ranking of swings 66–7
reservations 67
ROC (rank order centroid) 66–8
ROC weights concerns 68
snap decisions/initial intuitions 457–60
golfers and time pressure 458
intuitive catching 458
long-term experience effects 459
recognition heuristic 459
St Petersburg paradox 122–3
statistical models of judgment 450–7
extra model information 453
human model comparisons 453
linear models 451–5
heart failure example 453–4
using equal weights 452
why not more prevalent 453–5
models of forecasters predictions 451
policy capturing/bootstraping model 451–2
sales forecaster example 451
tendency to rely on own judgments 454
trust in experts/advisors 454
venture capitalists example 452
see also comparison of decision-aiding techniques
stochastic dominance 199–203

strategies, factors affecting 23–4
subjective probability 98–9, 389
and uncertainty 99
‘take the last’ heuristic 18
‘thinking outside the box’ 57
threats, people’s reaction 377–8
bolstering 377–8, 381
buck passing 377–8
conflict theory (Janis and Mann) 377
defensive avoidance 377, 378
procrastination 377
three jug problem 361–2
tornado diagram 302
transitivity 19
Tree Age Pro software package 166

uncertainty in decision making 2, 95, 99, 117–52
about uncertainty 117
decision tables 118–19
expected monetary value (EMV) criterion 119–24
maximum criterion 118–19
minimax criterion 119

utility/utility function
uncertainty management 297–307
about uncertainty and risk management 297–8,
305
brainstorming 303–5
exploratory tree 298–9
identifying/evaluating promising areas 300–3
perfect control, calculating the effect of 300–2
repeating for best option 302–3
probability distributions 298
tornado diagram 302
Two Valleys Company redeployment example 298–305
value trees 298
utility axioms
complete ordering 134
compound lottery 136–7
continuity 134
substitution 135
transitivity 134
unequal probability 135–6
utility/utility function 124–52
certainty-equivalence approach 137
with decision trees 166–8
hotel choice example 124–30
interpretation considerations 130–1
lottery ticket example 126–7
multi-attribute utility 143–52
utility/utility... (cont’d)
  for non-monetary attributes 132–4
  chemical plant design example 133–4
  and NPV with simulation 211–12
  practical use 140–3
  Allais’s paradox 141–2
  measuring problems 141
  single attribute utility 124–30
  utility elicitation 137–40
  elicitation session example 137–8
  gamble example 139–40
