ablative surgical techniques, 112–13
amygdaloid nucleus, 21
anterior spinocerebellar tract, 53
assessment of subcortical language disorders, 200–208
assessment of subcortical speech disorders, 275–7
ataxic dysarthria, see subcortical speech disorders
athetosis, see subcortical speech disorders, hyperkinetic dysarthria
ballism, see subcortical speech disorders, hyperkinetic dysarthria
basal ganglia, 5–7, 10–12, 18–29, 71–2, 77, 83, 97–8, 113–17
language disorders, historical perspective, 10–12; see also striatocapsular aphasia
neuroanatomy and functional neurology, 18–29, 97–8, 216–19
blood supply, 25–7, 97–8
circuitry and neurotransmission mechanisms, 22–3
pathology, 28–9
role in movement and cognition, 27
proposed roles in language, 113–7
role in Lexical Decision Making model, 77
role in Response-Release Semantic Feedback model, 71–2
role in Selective Engagement model, 83
speech motor control, historical perspective, 5–7
Boston Naming Test, 201, 203–4
brain stem, 35–48
neuroanatomy and functional neurology, 35–48
blood supply, 44–5
pathology, 45–8
role in movement and cognition, 45
caudate nucleus, 18–20
cerebellum, 7–9, 12–13, 48–58, 162–76
historical perspectives
language, 12–13
speech motor control, 7–9
influence on language, 162–76
in childhood, 173–4
clinical studies, 170–173
functional neuroimaging studies, 166–70
neuroanatomical evidence, 164–6
neuroanatomy and functional neurology, 48–58, 219–21
afferent connections, 53–5
blood supply, 51
circuitry, 57
efferent connections, 55–7
pathology, 57–8
role in movement and cognition, 51–7
speech disorders, see subcortical speech disorders, hyperkinetic dysarthria
chorea, see subcortical speech disorders, hyperkinetic dysarthria
corpus striatum, 18–21
corticopontocerebellar tract, 54
cuneocerebellar tract, 54
deep-brain stimulation, 146–53, 231–7
effect on speech, 232–7
impact on language function, 148–53
treatment for Parkinson’s disease, 146–8
degenerative subcortical syndromes, 180–194
hyperkinetic disorders, 181–2
essential tremor, 182–3
dyskinesia, 184
dystonia, 183–4
Huntington’s disease, 181–2; see also Huntington’s disease
hypokinetic disorders, 180–181
Parkinson’s disease, 181, 184–91; see also Parkinson’s disease
dentothalamic pathway, 56
dyskinesia, see degenerative subcortical syndromes
speech disorders, see subcortical speech disorders, hyperkinetic dysarthria
dystonia, see degenerative subcortical syndromes
speech disorders, see subcortical speech disorders, hyperkinetic dysarthria
essential tremor, 263
  see also degenerative subcortical syndromes

fastigial reticular pathway, 57
fastigial vestibular pathway, 57
functional neuroimaging, 13–14, 166–70

globose-emboliform-rubral pathway, 56
globus pallidus, 20–21, 114–16
  role in language, 114–16

Huntington’s disease, 181–2, 191–4, 256–8
  language disorders, 191–4
  speech disorders, see subcortical speech disorders, hyperkinetic dysarthria

hyperkinesias, 252–63
  quick, 252–8
  slow, 258–63
hyperkinetic dysarthria, see subcortical speech disorders
hypokinetic dysarthria, see subcortical speech disorders

internal capsule, 24–9
  blood supply, 25–7
  pathology, 28–9
  role in movement and cognition, 27

lemnisci, decussation of, 40–42
lentiform nucleus, 20–21
levodopa-induced dyskinesia, 261

medulla oblongata, 39–44, 47–8
  clinical significance, 47–8
midbrain, 35, 45–7
  clinical significance, 45–7
models of subcortical participation in language, 63–90, 139–46
  future research directions, 87–8
Lexical Decision Making model, 75–9, 142–4
  limitations, 85–7
Selective Engagement model, 79–85, 144–6
Subcortical White Matter Pathways model, 67–9
motor speech disorders, 9
myoclonic jerks, see subcortical speech disorders, hyperkinetic dysarthria

Neurosensory Centre Comprehensive Examination for Aphasia, 201–2

pallidotomy, 117–20, 121–9, 230–237
  case study, 127–9
  effect on speech, 232–7
implications for language, 118–20
neuropsychological findings, 118–20
Parkinson’s disease, 87–9, 180–181, 184–91, 245
  language disorders, 184–91
  dopamine, effect of, 189–91
  early investigations, 185–6
  relationship to cognitive status, 186–7
  semantic priming experiments, 187–9
  neurosurgical interventions, 88–9
  ratifying subcortical language theories, 87–8
  subthalamic deep-brain stimulation, see deep-brain stimulation

phrenology, 3
pons, 35–9
  clinical significance, 47
posterior spinocerebellar tract, 53–4
progressive supranuclear palsy, 245–6
pyramids, decussation of, 40
red nucleus, 22

semantic fluency tasks, 207
spinocerebellar tracts
  anterior, 53
  posterior, 53–4
striatocapsular aphasia, 102–7
  characteristics, 103–4
  cortical dysfunction, 105–7
  levels of language processing, 104–5
  prognosis, 107
subcortical language disorders, 200–210
  assessment of, 200–208
    recommended assessments, 201–208
    treatment of, 208–9
    compensatory and behavioural approaches, 209
    restorative approaches, 209
  see also striatocapsular aphasia; thalamic aphasia
subcortical speech disorders, 221–9, 244–69, 275–85
  assessment of, 275–7
ataxic dysarthria, 225–9, 264–8
  cerebellar disease, 265–6
  clinical characteristics, 265–8
  neurological framework, 264–5
  treatment of, 283–5
hyperkinetic dysarthria, 221–5, 251–63
  atehosis, 258
  ballism, 258
  chorea, 255–8
  dyskinesia, 259–61
  dystonia, 261–3
  essential voice tremor, 263
  myoclonic jerks, 252–4
  tics, 254–5
  treatment of, 277–85
hypokinetic dysarthria, 221–5, 245–51
  clinical characteristics, 246–51
  in Parkinson’s disease, 245
  in progressive supranuclear palsy, 245–6
  treatment of, 277–81
subcortical structures, 3–14, 18–59, 215–38
  language role, 3–14
  historical perspective, 9–14
  models, see models of subcortical participation in language
neuroanatomy and functional neurology, 18–59
  role in speech motor control, 5–9, 215–38
  evidence from neurosurgical studies, 229–37
  models, 223–8
substantia nigra, 21
subthalamic nucleotomy, 153–5
subthalamic nucleus, 21, 137–55
  in deep-brain stimulation, see deep-brain stimulation
  role in language, 137–55
Sydenham’s chorea, 256
tardive dyskinesia, 259–61
Test of Language Competence-Expanded edition, 201, 202–5
Test of Word Knowledge, 201, 206
thalamic aphasia, 98–102
  characteristics, 99–100
  lateralization, 100–101
  mechanisms, 101–2
  prognosis, 102
  case studies, 125–7
  effect on speech, 232–7
  implications for language, 120–121
  neuropsychological findings, 120–121
  language disorders, 98–102; see also thalamic aphasia
  neuroanatomy and functional neurology, 29–35
  blood supply, 31, 97–8
  pathology, 34–5
  role in movement and cognition, 31–33
  proposed role in language, 116–17
  role in Lexical Decision Making model, 76–7
  role in Response-Release Semantic Feedback model, 70–71
  role in Selective Engagement model, 80–83
The Word Test-Revised, 201, 205–6
  tics, see subcortical speech disorders, hyperkinetic disorders
treatment of subcortical language disorders, see subcortical language disorders, treatment of
Wiig–Semel Test of Linguistic Concepts, 201, 207
