1 Introduction 1

2 Method comparisons 5
   2.1 One measurement by each method 5
      2.1.1 Prediction of one method from another 8
      2.1.2 Why not use the correlation? 8
      2.1.3 A new method and a reference method 9
   2.2 Replicate measurements by each method 10
      2.2.1 Exchangeable replicates: fat data 10
      2.2.2 Linked replicates: oximetry data 11
      2.2.3 Why not use the averages of the replicates? 12
   2.3 More than two methods 13
   2.4 Terminology and notation 14
   2.5 What it is all about 14

3 How to... 17
   3.1 ... use this chapter 17
   3.2 Two methods 18
      3.2.1 Single measurements 18
      3.2.2 Comparing with a gold standard 18
      3.2.3 Replicate measurements 19
   3.3 More than two methods 19
      3.3.1 Single measurements 20
      3.3.2 Replicate measurements 20
4 Two methods with a single measurement on each

4.1 Model for limits of agreement
4.1.1 Prediction between methods
4.1.2 The correlation of the difference and the average

4.2 Non-constant difference between methods

4.3 A worked example

4.4 What really goes on
4.4.1 Scaling
4.4.2 Independence
4.4.3 Actual behavior

4.5 Other regression methods for non-constant bias
4.5.1 Why ordinary regression fails
4.5.2 Deming regression

4.6 Comparison with a gold standard

4.7 Non-constant variance
4.7.1 Regression approach
4.7.2 A worked example

4.8 Transformations
4.8.1 Log transformation

4.9 Summary

5 Replicate measurements

5.1 Pairing of replicate measurements
5.1.1 Exchangeable replicates
5.1.2 Linked replicates

5.2 Plotting replicate measurements

5.3 Models for replicate measurements
5.3.1 Exchangeable replicates
5.3.2 Linked replicates

5.4 Interpretation of the random effects

5.5 Estimation

5.6 Getting it wrong and getting it almost right
5.6.1 Averaging over replicates
5.6.2 Replicates as items

5.7 Summary
6 Several methods of measurement

6.1 Model

6.2 Replicate measurements

6.3 Single measurement by each method

7 A general model for method comparisons

7.1 Scaling

7.2 Interpretation of the random effects

7.3 Parametrization of the mean

7.4 Prediction limits

7.4.1 Mean of replicates

7.4.2 Plotting predictions between methods

7.4.3 Reporting variance components

7.4.4 Comparison with a gold standard

7.5 Estimation

7.5.1 Alternating regressions

7.5.2 Estimation using BUGS

7.5.3 A worked example

7.6 Models with non-constant variance

7.6.1 Linear dependence of residual standard error

7.7 Summary

8 Transformation of measurements

8.1 Log transformation

8.2 Transformations of percentages

8.2.1 A worked example

8.2.2 Implementation in MethComp

8.3 Other transformations

8.4 Several methods

8.5 Variance components

8.6 Summary

9 Repeatability, reproducibility and coefficient of variation

9.1 Repeatability
9.2 Reproducibility 109
9.3 Coefficient of variation 110
  9.3.1 Symmetric interval on the log scale 112
  9.3.2 Computing the CV correctly 113
  9.3.3 Transformations 113

10 Measures of association and agreement 115
  10.1 Individual bioequivalence criterion 116
  10.2 Agreement index 118
  10.3 Relative variance index 119
  10.4 Total deviation index 120
  10.5 Correlation measures 121
    10.5.1 Correlation coefficient 122
    10.5.2 Intraclass correlation coefficient 122
    10.5.3 Concordance correlation coefficient 124
  10.6 Summary 126

11 Design of method comparison studies 127
  11.1 Sample size 128
    11.1.1 Mean parameters 128
    11.1.2 Variance parameters 128
  11.2 Repeated measures designs 130
  11.3 Summary 131

12 Examples using standard software 133
  12.1 SAS 134
    12.1.1 Exchangeable replicates 134
    12.1.2 Linked replicates 136
  12.2 Stata 137
    12.2.1 Exchangeable replicates 137
    12.2.2 Linked replicates 139
  12.3 R 141
    12.3.1 Exchangeable replicates 141
    12.3.2 Linked replicates 143

13 The MethComp package for R 149
  13.1 Data structures 149
13.2 Function overview 150
  13.2.1 Graphical functions 150
  13.2.2 Data manipulating functions 151
  13.2.3 Analysis functions 151
  13.2.4 Reporting functions 152
