Index

Accelerating rate calorimeter, 362–63
Activation enthalpy, protein heat-induced transformations with, 129
Adiabatic measurement methods accelerating rate calorimeter, 362–63
Dewar vessels, 361–62
food-processing safety with, 361–63
Adiabatic temperature rise, 353
ADSC. See Alternating DSC
Aggregation
DSC technique with vessel/heating mode with, 28t
globular proteins in bulk phase system, 124–29, 126f–128f
heat effects of, 88
heating mode with, 36–37, 37f
protein postdenaturation, 110–12
Alcohols, protein denaturation affected by, 99–100, 101f
11S globulin, 99–100, 101f
Setschenow equation for, 100
Alfalfa, 93
Alginate, denaturation temperature of β-lactoglobulin with, 110
Alternating DSC (ADSC), food-processing design with, 204
AMF. See Anhydrous milk fat
Ampoule mixing vessel, mixing and reaction heat flux microcalorimeter with, 30, 31t
Anhydrous milk fat (AMF)
Avrami plots from, 139f
calorimetric parameters observed with, 136t
heat-induced transformations with, 133–41, 135f, 136t, 137f, 139f, 139t, 140f, 184–87, 186f, 187f
heating/cooling curves, 135f
isothermal curves, 137f
protein-stabilized, 135f
surfactant added, 135f, 136t, 137f
Antibiotics, 153–55, 153f, 155f
Apple, heat capacity for, 36t
Arabic gum, denaturation temperature of 11S globulin with, 106t
Autocatalysis, 356
Autoclave, 54, 54f, 55f, 57
Avrami equation, oil-in-water emulsions with, 138–39, 139f, 139t
Bacillus megaterium, DSC analysis of, 149

Bacteria

Bacillus megaterium DSC analysis of, 149
calorimetry with growth of, 43
Citrobacter freundii DSC analysis of, 149
Clostridium perfringens DSC analysis of, 149–53, 151f
results for, 150–52, 151f
sample preparations for, 149–50
DSC analysis of foodborne, 147–64, 151f, 153f, 155f, 157f, 160f, 162t
antibiotics’ effect on, 153–55, 153f, 155f
cold shocking, 148
heat shocking, 148, 151
DSC technique v. vessel/heating mode with, 28t
endothermic/exothermic effects of, 19t
Escherichia coli DSC analysis of, 148, 155–58, 157f
erythromycin treatment of, 154–55, 155f
heat inactivation parameters of, 159–60, 160f
nonthermal treatment of, 162–63, 162t
food-processing’s effect on, 10–11
food-processing treatment evaluation by DSC for, 158–64, 160f, 162f
antimicrobials in, 163–64
heat inactivation parameters of bacteria in, 158–61, 160f, 162f
HHP in, 161
nonthermal treatment of bacteria in, 161–63, 162f
hydrostatic pressure resistance of, 44–45, 44f
inactivation of, 10
Lactobacillus plantarum DSC analysis of, 155–58, 157f
Listeria monocytogenes DSC analysis of, 149–53, 151f
antibiotics’ effect on, 153–54, 153f, 155f
heat inactivation parameters of, 159
results for, 152–53, 152f
sample preparations for, 149–50
Mycoplasma laidlawii DSC analysis of, 149
Staphylococcus aureus
nonthermal treatment, 162–63, 162t
Batch high-pressure vessel, mixing and reaction heat flux microcalorimeter with, 29, 31t
Batch mixing vessel, high sensitivity heat flux calorimeter with, 27, 28t
Batch standard vessel, mixing and reaction heat flux microcalorimeter with, 29, 31t
Benzene, transiometry verification test using, 322, 323f

Binding
data quantifies high-affinity, 75–77
mixing and reaction calorimetry with, 41–42
processes, protein in dilute solution with, 78, 79, 80f
Blank test heat flow equation, 32
Bovine β-lactoglobulin, 94–95
Bovine serum albumin (BSA), protein denaturation affected by, 104
Broad beans, 11S globulin from, 99–100, 101f, 105
BSA. See Bovine serum albumin
Bulk phase system, denaturation-aggregation of globular proteins in, 124–29, 126f–128f
Butter, heat capacity for, 36t
Butyric acid, melting point of, 171f
Cabbage, heat capacity for, 36t
Calibration, 23–25, 24f, 25f
Calvet type calorimeter, 23, 206
Calorimeter accelerating rate, 362–63
symmetrical, two-chamber, 17–18
Calorimetry. See also Calvet type calorimetry; Differential scanning calorimetry; Heat flux calorimeters; Heat flux microcalorimetry; High pressure calorimetry; High pressure differential scanning calorimetry; High-sensitivity calorimetry; High sensitivity heat flux calorimeter; Isothermal calorimetry; Isothermal solution calorimetry; Isothermal titration calorimetry; Microcalorimetry; Mixing and reaction calorimetry; Mixing and reaction heat flux microcalorimeter; Pressure calorimetry
advantages for using, 7
applications of, 15–45
under controlled relative humidity, 45
food dehydration understood with, 289–309
calorimetric glass transition measurement for, 293–96, 294f, 296f
dielectric and mechanical relaxations with, 296f, 297–98
freeze-drying for, 290, 306–7
freezing in, 301–3, 302f, 303f
glass transition and stability of, 307–8, 308f
phase and state transitions of, 290, 292–93, 293f
Calorimetry (continued)
spray-drying for, 290, 305–6, 306f
state diagrams with, 303–7, 304f
thermal analysis in, 298–301, 299f, 300f
food industry interest in, 226
food-processing design in, 202–6
alternating DSC, 204
Calvet type calorimetry, 203, 206
differential scanning calorimetry, 202–6
differential thermal analysis, 203
dynamical mechanical analysis, 225
dynamical mechanical thermal analysis, 225
methods, 205–6
modulated DSC, 204
samples, 206
techniques, 203–5, 204f
food-processing safety evaluated with, 351–66, 354f, 355f, 357f–359f
adiabatic measurement methods for, 361–63
applications for, 364–66
concepts for, 352–56, 354f, 355f
critical conditions in, 354–56, 355f
critical heat release rate in, 354–55
critical temperature, 355–56, 355f
estimation of q’(T) in, 357–60, 359f
formation of hot spots in dryers, 364
high-sensitivity calorimetry in, 361
isoconversional methods in, 360–61
open v. closed measurement methods in, 357, 357f, 358f
prevention of molasses incidents, 365
reactions with oxygen in, 363–64
screening in, 356–57
storage and hot discharge, 364–65
transport safety, 365–66
isothermal, 38
isothermal performance of, 19
isothermal solution, 220
methods with food using, 5–13
parameters of, 8
interpretation of overlapping peaks, 8
magnitude of heat flow, 8
moisture loss, 8
time scale, 8
pressure, 43–45, 44f
scanning mode, 35–36, 44
solution, 218
step heating in, 40, 40f
suitability for food of, 52
ultrasensitive to proteins, 8
Calvet principle, 22–23, 22f, 23f, 26
Calvet type calorimetry, 22–23, 22f, 23f, 203
calibration of, 23, 206
food-processing design with, 203, 206
Capric acid, melting point of, 171f
Caproic acid, melting point of, 171f, 172f
Caprylic acid, melting point of, 171f
Carbohydrates
C80 technique v. vessel/heating mode with, 31t
Cereal with, 12
endothermic/exothermic effects of, 19t
gelatinization of starch-water systems, 207
glass transition with, 294
hydrophilic component of, 291
thermal analysis of cereal
nonstarch, 276–78, 277f
thermal behavior of food constituents in, 206–8, 207f, 208f
Carboxymethylcellulose, denaturation temperature of 11S globulin with, 106t
Carp, heat capacity for, 36t
κ-Carrageenan
denaturation temperature of 11S globulin with, 106t
denaturation temperature of β-lactoglobulin with, 110
λ-Carrageenan
denaturation temperature of 11S globulin with, 106t
denaturation temperature of β-lactoglobulin with, 110
Carrots, isothermal traces at temperatures for, 39f
Caseins, 122–23
CB. See Cocoa butter
Cellulobiose, calorimetric curves of, 208f
Centre National de la Recherche Scientifique (CNRS), 176
Cereal, 12
C80 technique v. vessel/heating mode with, 31t
Cereal processing, thermal analysis to design/monitor, 265–85
nonstarch carbohydrates, 276–78, 277f
process applications, 278–85, 280f–284f
proteins, 272–76, 274f, 275f
starch, 268–72, 289f–272f
Chaotropic salts (Salting-in salts), 95
Chocolate
C80 technique v. vessel/heating mode with, 31t
DSC technique v. vessel/heating mode with, 28t
Citrobacter freundii, DSC analysis of, 149
Closed measurement method, 357, 357f, 358f
Clostridium perfringens
DSC analysis of, 149–53, 151f
results for, 150–52, 151f
sample preparations for, 149–50
CNRS. See Centre National de la Recherche Scientifique
Cocoa butter (CB)
DSC and XRD with, 179–84, 180f, 183f
MICROCALIX for, 182–84, 183f
polymorphism, 181–82f
polymorphism of 1,2-dipalmitoyl-3-oleoylglycerol, 182–84, 183f
Coffee, C80 technique v. vessel/heating mode with, 31t
Cold denaturation, protein in dilute solution with, 75
Cold shocking, 148
Complete reaction, test for, 255
Cream, heat capacity for, 36t
Critical conditions, food-processing safety with, 354–56, 355f
heat release rate, 354–55
temperature, 355–56, 355f
Crystallization
  DSC technique v. vessel/heating mode with, 28t
  heating mode with, 36
  isothermal, 39
  lard, 190, 191f, 191t
  lipids, 210–11
  milk fat, 189–90
  oil-in-water emulsions, 132–36, 135f, 136t
  water in pork muscle with, 327f
CSC, 21

Dairy, heat capacity for, 36t
Debye-Höckel approximation, 98, 99t
Dehydration. See Food dehydration
Denaturation
  cold, protein in dilute solution with, 75
defined, 122
  DSC technique v. vessel/heating mode with, 28t
  globular proteins in bulk phase system, 124–29, 126f–128f
11S globulin, 89–92, 91f
  alcohol’s effect on, 99–100, 101f
different pH values in, 91f, 92
  polysaccharides’ effect on, 105–6, 106t, 110
  salt’s effect on, 96–98, 97f, 99t
two-state model to analyze, 89
  heat effects of, 88
  heating mode with, 36–37, 37f
  Kunitz inhibitor, polysaccharides’ effect on, 107–10, 108f
  β-lactoglobulin, 125
methodological approaches to study, 89
  of protein, 87–113, 91f, 97f, 99t, 101f, 103f, 106t, 108f
  effects of alcohols on, 99–100, 101f
effects of odorants on, 102–4, 103f
effects of pH on, 89–95, 91f
effects of polysaccharides on, 104–10, 106t, 108f
effects of salts on, 95–99, 97f, 99t
  reversibility of, 123
two-state model of, 123
Dewar vessels, 361–62
Dextran, denaturation temperature of 11S globulin with, 106t, 108f
Dextran sulfate, 106t, 108f
Differential scanning calorimetry (DSC), 6–7, 9, 16, 265
  Bacillus megaterium analysis by, 149
calibration of, 23–25, 24f, 25f
Calvet principle with, 22–23, 22f, 23f, 26
Calvet type of, 22–23, 22f, 23f, 203, 206
calibration of, 23, 206
efficiency ratio of, 23f
schematic of, 22f
Citrobacter freundii analysis by, 149
Clostridium perfringens analysis by, 149–53, 151f
  results for, 150–52, 151f
sample preparations for, 149–50
cold denaturation with, 75
data quantifies high-affinity binding with, 75–77
assumptions of, 75
concentration in, 77
equilibrium in, 76–77
Index

hydrogen ion buffer selection in, 77
purity in, 77
two-state, reversible transitions in, 76–77
efficiency ratio of flat-shaped, 21f
Escherichia coli analysis by, 148, 155–58, 157f
erthyromycin treatment of, 154–55, 155f
heat inactivation parameters of, 159–60, 160f
nonthermal treatment of, 162–63, 162t
foodborne bacteria analysis by, 147–64, 151f, 153f, 155f, 157f, 160f, 162t
antibiotics’ effect on, 153–55, 153f, 155f

with XRD, 225
food-processing safety with, 355f, 356–61, 357f–359f
estimation of q’(T) for, 357–60, 359f
high-sensitivity calorimetry for, 361
isoconversional methods for, 360–61
open v. closed measurement methods for, 357, 357f, 358f
screening for, 356–57
food-processing treatment evaluation by, 158–64, 160f, 162f
antimicrobials in, 163–64
heat inactivation parameters of bacteria in, 158–61, 160f, 162f
HHP in, 161
nonthermal treatment of bacteria in, 161–63, 162f
glass transition with, 294f
heat flux type of, 20–21, 26–30, 27f, 28t
heating’s role in, 88
high pressure, 51–64, 54f–56f, 60f, 62f
applications of, 63
calibration of, 57–63, 60f, 62f
construction of, 53–57, 54f–56f
Lactobacillus plantarum analysis by, 155–58, 157f
Listeria monocytogenes analysis by, 149–53, 151f
antibiotics’ effect on, 153–54, 153f
heat inactivation parameters of, 159
results for, 152–53, 152f
sample preparations for, 149–50
microcalorimetry v., 16, 19–25, 20f–25f
heat flux microcalorimetry, 19–25, 20f–25f
Mycoplasma laidlawii analysis by, 149
power compensated type of, 20–22
protein in dilute solution with, 68–77, 71f
equations, 70–74, 71f
heat capacity change origins for, 74
information content, 68–69
instrumentation, 69–70
Differential scanning calorimetry (DSC) (continued)
simulated DSC thermogram of, 70, 71f
van’t Hoff enthalpy change, 72–74
schematic of plate-shaped sensor for, 20f
schematic representation of, 299f
sensor plate thickness in efficiency of, 21f
Staphylococcus aureus
nonthermal treatment with, 162–63, 162t
starch analysis with, 268–72, 289f–272f
starch gelatinization by heat monitored with, 342, 343f
two types of, 20
X-ray diffraction with, 169–94, 171t, 172t, 173f, 177f, 180f, 183f, 186f, 187f, 189f, 191f, 192f
applications for, 179–93, 180f, 183f, 186f, 187f, 189f, 191f, 192f
cocoa butter in, 179–84, 180f, 183f
lard in, 190–93, 191f, 192f
MICROCALIX using, 170, 176–79, 177f, 180f, 183f, 186f, 187f, 189f, 191f, 192f
milk fat in, 184–90, 186f, 187f, 189f
results using, 179–93, 180f, 183f, 186f, 187f, 189f, 191f, 192f
triacylglycerols in, 169–76, 171t, 172t, 173f
Differential thermal analysis (DTA), 53, 173
food-processing design with, 203
Dilute solution, calorimetry of protein in, 67–84, 71f, 80f, 83f
Dilute systems, 10
Dissolution, mixing and reaction calorimetry with, 41
DMA. See Dynamical mechanical analysis
DMTA. See Dynamical mechanical thermal analysis
Drying
freeze-, 290, 306–7
hot spots with, 13
spray-, 290, 305–6, 306f
DSC. See Differential scanning calorimetry

Fourier transform infrared spectroscopy, 11
Free protein, denaturation temperature of 11S globulin with, 106t
Freeze-drying, 290, 306–7
Fruit, heat capacity for, 36t
Galactose, calorimetric curves of, 208f
Gas-flow vessel, mixing and reaction heat flux microcalorimeter with, 29, 31t
Gelatin, endothermic/exothermic effects of, 19t
Gelatin gels, frozen water ratio in, 326–29, 328f
Gelatinization
DSC technique v. vessel/heating mode with, 28t
heating mode with, 38
starch, 12, 274, 278–79, 280f
calorimetric analysis by HPP of, 341–49, 343f, 346f
heat in, 342, 343f
high pressure calorimetry on, 330–36, 332f–334f, 335t
storage of, 347–48
thermodynamic data for, 335t
wheat, 344–47, 346f
starch-water systems, 207
Gelatin molecules, 122
Gelation, heating mode with, 37–38
Gibbs function, 267
Glass transition, 290–92
behavior of lactose with, 300f
calorimetric measurement for, 293–96, 294f, 296f
cooling/heating with, 295
DSC technique v. vessel/heating mode with, 28t
DSC with, 294f
Gordon-Taylor equation with, 300
mechanical/dielectric relaxations in, 296f, 297
stability of dehydrated materials with, 307–8, 308f
studies referring to, 291
sugar/carbohydrates with, 294
two or more components with, 295
Globulin, 7S, different pH values in denaturation of, 93
Globulin, 11S
alcohols effect on protein denaturation using, 99–100, 101f
broad beans, 99–100, 101f, 105
denaturation of, 89–92, 91f
different pH values in, 91f, 92
two-state model to analyze, 89
polysaccharides effect on protein denaturation using, 105–6, 106t, 110
β-glucosidase, ITC of binding inhibitors to, 80f
Gompertz model, oil-in-water emulsions with, 139–40, 139t, 140f
Gordon-Taylor equation, 300, 304
Grapefruit, heat capacity for, 36t
Guar gum, denaturation temperature of β-lactoglobulin with, 110
Heat calibration procedure, HP-DSC, 60f, 61–63, 62f
Heat capacity
  constant pressure processes with, 30
  defined as ratio, 30
  determination, 30–35, 33f, 34f, 36t
  foods in, 35, 36t
  liquids in, 34–35, 34f
  temperature-scanning mode in, 31–33, 33f
  temperature step mode in, 33–34
DSC with, 6
  formula for heat flux with, 17
Heat flow
  blank test heat flow equation, 32
  magnitude of, 8
Heat flux
  electrical signal’s correlation with, 24
  pork muscle crystallization with, 327f
  pork muscle thawing with, 326f
  power dissipation’s correlation with, 24
  pressure shift freezing with, 330f
  ratio of measured to total, 20–21, 21f
Heat flux calorimeters, 20–21, 26–30, 27f, 28t
  high sensitivity, 26–27, 27f, 28t
  batch mixing vessel for, 27, 28t
  fluid mixing vessel for, 27, 28t
  mixing vessels for, 27, 27f
  temperature control in, 26
  thermal conductive block of, 26
  mixing and reaction, 29–30, 31t
  ampoule mixing vessel for, 30, 31t
  batch high-pressure vessel for, 29, 31t
  batch standard vessel for, 29, 31t
  gas-flow vessel for, 29, 31t
  membrane mixing vessel for, 29–30, 31t
  mixing vessel for, 29, 31t
Heat flux calorimetric principle, 17–19, 18f, 19t
  parts of, 17
  temperature equivalent formula for, 17
  thermal contribution due to heat capacity formula for, 17
Heat flux microcalorimetry, DSC v., 19–25, 20f–25f
  calibration in, 23–25, 24f, 25f
  Calvet principle in, 22–23, 22f, 23f, 26
Heat-induced transformations
  oil-in-water emulsions with, 132–41, 135f, 136t, 137f, 139f, 139t, 140f
  anhydrous milk fat, 133–41, 135f, 136t, 137f, 139f, 139t, 140f, 184–87, 186f, 187f
  Avrami equation for, 138–39, 139f, 139t
  crystallization in, 132–36, 135f, 136t
  fat crystal growth in, 138
  Gompertz model for, 139–40, 139t, 140f
  ice cream, 133
  kinetics of, 136–41, 137f, 139f, 139t, 140f
  melting of fat droplets in, 132–36, 135f, 136t
triacylglycerols, 133
whipped cream, 133
peak temperatures and heat of reaction in, 128f
protein solutions with, 119–32, 126f–128f, 130f, 131t, 132f, 141
activation enthalpy of, 129
denaturation-aggregation of globular proteins in, 124–29, 126f–128f
entropy of, 129
kinetics of, 129–32, 130f, 131t, 132f
Lumry-Eyring model for, 129, 130f, 131t
protein structures in, 121–23
thermodynamics of, 123–24, 129–32, 130f, 131t, 132f
whey protein isolate in, 125, 126f, 128f, 132f
Heating mode, 35–40, 37f, 39f, 40f
aggregation, 36–37, 37f
crystallization, 36
denaturation, 36–37, 37f
gelatinization, 38
gelation, 37–38

two-state model of, 123
thermodynamic compatibility of denatured/native, 89
ultrasensitive calorimetry to, 8
Protein-protein interactions
(Exothermic reaction), 127–28
PSF. See Pressure shift freezing
Q, calculation of, 256–60, 260f
Rate constant, calculation for, 254–55
RBPC. See Ribulose 1,5 biphosphate carboxylase
Reaction enthalpy, calculation for, 255
Reaction half-life, calculation for, 254
Reaction kinetics, model of based on, 249–51
Reaction order, calculation for, 252–53
Retrogradation
DSC technique v. vessel/heating mode with, 28t
heating mode with, 28t, 38
starch, 270
Ribulose 1,5 biphosphate carboxylase (RBPC),
different pH values in denaturation of, 93
Saccharides, dissolution behavior of, 219
Safety. See Food-processing safety; Transport safety
Salmon, heat capacity for, 36t
Salting-in salts. See Chaotropic salts
Salting-out salts. See Kosmotropic salts
Salts
C80 technique v. vessel/heating mode with, 31t
chaotropic, 95
kosmotropic, 95
protein denaturation affected by, 95–99, 97f, 99t
Debye-Höckel approximation for, 98
β-lactoglobulin, 96–98, 97f, 99t
Scanning mode, 35–36, 44. See also Temperature-scanning mode
heating curves for different rates of, 127f
Scanning transitiometry, 311–38, 317f–319f, 321f, 323f, 324f
applications of, 324–37
frozen water ratio in gelatin gels, 326–29, 328f
gelatinization of starch, 330–36, 332f–334f, 335t
phase stability of lipid containing systems, 336–37, 337f
pressure shift freezing, 329–30, 329f–331f
water in pork muscle, 324–26, 326f, 327f
benzene as verification test for, 322, 323f
calibration of, 322–23
calorimetric vessels in, 319–20
piston pump in, 320
precautions for, 321–22
pressure detector in, 320
schematic diagram of, 319f
scheme of basic principles of, 317f
temperature and energy scales of, 322
thermodynamic scheme of, 318f
transitiometric vessels for, 321f

Self-ignition temperature, 364
Setschenow equation, 100
SFC. See Solid fat content
Shelf life, 237–61
empirical model fitting for analysis of, 246–49, 246f, 249f, 250f
heating mode with, 38, 39f
qualitative studies on, 239–45, 241f
quantitative studies on, 245
reaction kinetics based model of, 249–51
reactions that proceed to completion for analysis of, 252–55
calculation for rate constant, 254–55
calculation for reaction enthalpy, 255
calculation for reaction half-life, 254
calculation for reaction order, 252–53
calculation for total heat released, 253–54
calculation of initial calorimetric signal $\theta_0$, 252
reactions that proceed to equilibrium in analysis of, 255–60, 260f
calculation of $Q_T$, 256–60, 260f
determination of $K$, 255–56
test for complete reaction, 255

Skim milk powder (SMP), moisture content of, 222–24, 223f
Small-angle X-ray diffraction (SXRD), 176
lard in, 191t, 192f
SMP. See Skim milk powder
Sodium alginate, denaturation temperature of 11S globulin with, 106t

Solid fat content (SFC), 209–10
Solubility, mixing and reaction calorimetry with, 41
Solution calorimetry, 218
Specific heat
moisture content’s effect on thermodynamic response with, 219–20
parameters for food-processing design of, 224–25
pharmaceutical substances, 219
solution calorimetry with, 218
Spindle pump, HP-DSC, 54f
Spray-drying, 290, 305–6, 306f

Staphylococcus aureus
hydrostatic pressure resistance of, 44, 44f
nonthermal treatment of, 162–63, 162t

Starch
C80 technique v. vessel/heating mode with, 31t
cereal with, 12
DSC technique v. vessel/heating mode with, 28t
endothermic/exothermic effects of, 19t
gelatinization, 12, 274, 278–79, 280f
calorimetric analysis by HPP of, 341–49, 343f, 346f
heat in, 342, 343f
Starch (continued)
  high pressure calorimetry on, 330–36, 332f–334f, 335t
  storage of, 347–48
  thermodynamic data for, 335t
  wheat, 344–47, 346f
  HHP’s effects on, 12
  retrogradation, 270
  thermal analysis of cereal processing with, 268–72, 289f–272f
  aqueous suspension of starch granules for, 268
  DSC for, 268–72, 289f–272f
  State diagrams
    food dehydration in, 303–7, 304f
    freeze-drying, 290, 306–7
    lactose, 304f
    spray-drying, 290, 305–6, 306f
  State transitions, food dehydration in, 290, 292–93, 293f
  Stearic acid, melting point of, 171f, 172f
  Step heating, calorimetry with, 40, 40f
  Sucrose, calorimetric curves of, 207f, 208f
  Sugar
    C80 technique v. vessel/heating mode with, 31t
    calorimetric curves of sucrose, 207f, 208f
    DSC technique v. vessel/heating mode with, 28t
    glass transition with, 294
    thermal behavior of food constituents in, 206–8, 207f, 208f
  SXRD. See Small-angle X-ray diffraction
  TCC. See Temperature-controlled cryostat
  Temperature, critical, 355–56, 355f
  Temperature calibration procedure, HP-DSC, 58–61
  Temperature-controlled cryostat (TCC), 177f
  Temperature modulated DSC (TMDSC), 265
  Temperature-scanning mode
    blank test heat flow equation, 32
    heat capacity determination using, 31–33, 33f
  Temperature step mode, heat capacity determination using, 33–34
  TG. See Triacylglycerols
  TGA. See Thermogravimetry
  Thermal analysis (TA). See also
    Differential thermal analysis;
    Dynamical mechanical thermal analysis
    design/monitor of cereal processing, 265–85
    nonstarch carbohydrates, 276–78, 277f
    process applications, 278–85, 280f–284f
    proteins, 272–76, 274f, 275f
    starch, 268–72, 289f–272f
    food dehydration understood with, 298–301, 299f, 300f
    food-processing design with, 203–6, 204f
    methods, 205–6
    samples, 206
    techniques, 203–5, 204f
  Thermogravimetry (TGA), 265
  Time scale, calorimetry with, 8
  Tin, HP-DSC calibration using, 58, 59
  TA. See Thermal analysis
TMDSC. See Temperature modulated DSC
Total heat released, calculation for, 253–54
Transiometry scanning technique, 12
Transition state theory, 111
Transport safety, 365–66
Triacylglycerols (TG)
composition of, 169
DSC and XRD in study of, 169–76, 171t, 172t, 173f
fatty acids, 170–73, 171t, 172t, 173f
crystallographic/energetic properties of, 172f
hexagonal, 172, 172f, 173f
melting point of, 171f, 172f
orthorhombic perpendicular, 172, 172f, 173f
triclinic parallel, 172, 172f, 173f
heat-induced transformations with, 133
main types of, 173f
melting profile of, 209
polymorphism of, 170–73, 171t, 172t, 173f, 209–10, 210f
Trypsin inhibitor, 94
Vanillin, 102
Van’t Hoff enthalpy change, DSC measured, 72–74
Vegetable, heat capacity for, 36t
Water. See also Oil-in-water emulsions
emulsifier-water systems with lipids, 212–14
frozen water ratio in gelatin gels, 326–29, 328f
gluten fix with molecules of, 273
pork muscle with, 324–26, 326f, 327f
starch-water systems, 207
thermal behavior of food constituents in, 216–17
Wheat, starch gelatinization by HHP for, 344–47, 346f
results with, 345–47, 346f
sample preparation for, 345
Whey protein isolate, heat-induced transformations with, 125, 126f, 128f, 132f
Whipped cream, heat-induced transformations with, 133
Wide-angle X-ray diffraction (WXRD), 175
lard in, 191t, 192f
WXRD. See Wide-angle X-ray diffraction
Xanthan, denaturation temperature of β-lactoglobulin with, 110
X-ray diffraction (XRD), 11
applications with DSC and, 179–93, 180f, 183f, 186f, 187f, 189f, 191f, 192f
cocoa butter in DSC and, 179–84, 180f, 183f
DSC with, 169–94, 171t, 172t, 173f, 177f, 180f, 183f, 186f, 187f, 189f, 191f, 192f
food-processing design with DSC and, 225
lard in DSC and, 190–93, 191f, 192f
MICROCALIX using DSC and, 170, 176–79, 177f
milk fat in DSC and, 184–90, 186f, 187f, 189f
X-ray diffraction (XRD) (continued) results using DSC and, 179–93, 180f, 183f, 186f, 187f, 189f, 191f, 192f triacylglycerols in DSC and, 169–76, 171t, 172t, 173f X-ray diffraction with temperature function (XRDT), 11, 176 X-ray diffraction with time function (XRDt), 11, 176 XRD. See X-ray diffraction XRDT. See X-ray diffraction with temperature function XRDt. See X-ray diffraction with time function
