Accrued interest, 46–49
American swaptions, 250
Annuities, formulas for duration and convexity, 38–40
Asset duration, 333–334

Banking crises in developing countries, 3–4
Barbell/ladder/bullet portfolios:
  - key rate durations, 274, 303
  - principal component durations/model, 304, 308
  - stochastic process risk, 87
Bermudan swaptions, 250
Black and Cox model (default-prone securities), 352, 353–356
Black-Scholes-Merton option-pricing model, 334
Bond index replication, 126
Bond options, hedging with (a general Gaussian framework), 180–217
durations of European options on coupon bonds and callable coupon bonds, 203–217
callable coupon bond, 215–216
call option on a coupon bond, 208–214
coupon bond options using Vasicek and extended Vasicek models, 207–217
generalization to extended Vasicek model, 216–217
put option on a coupon bond, 214–215
zero-coupon bond, 207–208
duration vectors of bond options, 186–196
  - bounds, 191–193
  - call options, lower bound on duration vector of, 191–192
  - estimation, using implied volatilities, 195–196
  - estimation, using non-Gaussian term structure models, 202–203
  - put options, upper bound on duration vector of, 192–193
duration vectors of callable bonds, 196–202
general Gaussian framework for pricing zero-coupon bond options, 181–186
numerical simulations, 193–195
bond volatility, 194, 200–201
exercise price, 193–194, 200
interest rate, 194–195, 201–202
Bond price(s):
  - and spot rates and forward rates, 45–55
  - under continuous compounding, 16–20
  - yield relationship with tangent line (graph), 25
Bootstrapping method, 45, 55–60
Bullet/barbell/ladder portfolios:
  - key rate durations, 274, 303
  - principal component durations/model, 304, 308
  - stochastic process risk, 87
Callable zero, 36
Call options, 191–192, 208–214
Call risk, interaction of interest rate with, 14–15
Caps/caplets, pricing/hedging with, 239–244
comparative analysis, floors/collars, 254–263
duration vector (using LIBOR market model):
cap, 243–244
caplet, 242–243
pricing, 239–242
Collars, interest rate:
comparative analysis (caps/floors), 254–263
duration vector, 248
embedded, pricing of floating-rate bonds with, 248–249
pricing and hedging with (LIBOR market model), 247–248
Collateralized mortgage obligations (CMOs), 312
Collin-Dufresne and Goldstein model, 353, 370, 371–376
Comparative cost advantage, 223
Complex securities, principal component risk measures, 324–325
Continuous compounding, bond prices under, 16–20
Conversion factor (T-bond futures), 160–161
Convexity(ies):
defined, 6, 25–26
interest rate risk models (see
Duration and convexity models)
M-square versus, 76, 90–99
ex-ante returns, 97–98
immunization risk, 98–99
paradox, 92, 93–97
principal component durations and, 300–304
risk and (graph), 100
theta trade-off, 42
Corporate bonds and stocks, 328–331
Coupon effect, 49
Credit risk, interaction of interest rate risk with, 14
Credit spread changes, interest rate changes and, 349–352
Cubic-spline method (McCulloch), 60–67
Day-count basis, 47–48, 221–222
actual/actual, 47
actual/360, 47, 48, 221
actual/365, 221
