triplet-triplet annihilation 5
- Ir(ppy), and Alq3 297, 300
- iridium complexes 385
- organometallic complexes 134
- polymer-based electrophosphorescent devices 222
- spin persistence 122

triplets 40–45
- density 106

- diffusion rate 114
- diffusivity 108
- electric field modulated fluorescence 107
- emission overshoot 123

vibration, color see color tuning
two-phonon Raman scattering 51

\nu

vacuum deposition
- Er-containing OLEDs 412
- thermal stability 177

vibrational satellite structures 63–76
- Herzberg–Teller-induced emission 69–70
- low-temperature 75–76
- side bands 63
- temperature-time-dependence 68–74
- time-resolved emission 72–74

vibrational satellites
- background 63–76
- cage modes 70
- decay times 72
- dipole moment 65
- FC activity 63–66, 70, 72–74, 75–76
- harmonic oscillator functions 65
- harmonic potentials 64
- HT activity 66–70, 72–74
- organo-transition metal compounds 39
- Pt(thpy)2 70
- substates 70–72

temperature-time-dependence 68–74
time-resolved emission 72–74

voltage characteristics see current–voltage characteristics

\w

wavefunctions
- LC excitation 13
- overlap 37
- recombination 9
- triplet substates 24
- vibrational satellites 65

\y

ytterbium complexes 411–415
yttrium complexes 415–417

\z

Zeeman shifts 59
zero-field splitting (ZFS) 38–39, 78–80
- admixtures 38
- allowedness 30
– emitter compounds 32–33
– ligand-centered (LC) excitation 14
– metal-to-ligand charge transfer 24–29
– ordering scheme 31–34

– site energy distribution 78
– transitions 79
– triplet emitters 2, 29–40
– triplet substates 39

zero-phonon line (ZPL) 83–86
