Index

absorption coefficient, 69, 244, 246–247, 254, 256–257, 260, 457
acceleration transfer matrix, 415
acoustic (air)
density, 53, 145
particle velocity, 74
stiffness, 61, 117, 122, 129
modal form, 124
acoustic impedance (normal to surface), 53, 151
absorber (porous material), 55, 59, 62–65, 78, 80, 117–118, 147, 151–152, 201, 242–243
average for the nth mode, 59
damping matrix, 148
flexible wall, 55, 61, 117–118, 147
modal matrix, 168, 412
oscillating sphere surface, 78
piston surface, 75
pulsating sphere surface, 76
acoustic intensity, 44, 72, 74, 83, 91–92, 102, 457
acoustic modal
damping ratio, 118
force, 59, 120
mass, pressure, sound source, displacement, 116
phase, 69
acoustic participation factors, 166
energy, 169
mode, 167
boundary panel, 167–168
acoustic reactance, 92–95, 151
acoustic resistance, 92–95, 151
acoustic transfer function, 168 see also vibro-acoustic, transfer function
acoustic velocity potential, 53, 133, 159
acoustic volume
displacing mode, 83
flow (velocity), 75, 168, 409, 411
flow rate (acceleration), 168
acoustic wave equation, 53, 74, 78, 80, 115, 145, 436
active noise control, 68
adjoint operator, 286–287
admittance, 32, 153, 264
airborne noise, 8, 174
aleatory uncertainty, 306
analysis frequency range, 6
anti-optimization method, 308 see also uncertainty quantification
apparent mass matrix, 429
applications
aircraft, 272, 380–381, 461–464, 495–499
automotive, 7, 402–403, 455–461
bells, 273
launch vehicle, 381, 399–400
loudspeakers, 272
marine/naval, 464–470
railway, 272
vehicle interior noise, 161, 167, 170, 175–176, 426–428
attenuation, 252–253
band gap phenomenon, 473, 500
bandwidth, 30
damping decrement modal, 120
half-power, 65
beam
Euler–Bernoulli beam, 14–15, 23, 472, 477, 493, 494
Timoshenko beam, 14–15, 473, 476, 477, 493, 494, 497
bending rigidity, 119, 155
bending waves, 14–21, 39–41
anisotropic plates, 17–20
stiffened plates, 20–21
infinite plates, 39–41
Bernoulli equation, 133
Bernoulli–Euler, 14–15, 23
biharmonic operator, 119, 155
Biot theory, 249, 257, 264 see also poroelastic material
Bloch–Floquet theory, 486 see also wave propagation functions/consts
boundary conditions, 235, 238, 263, 478, 500–501
acoustic, 55, 115, 118, 140, 145, 147, 154
beam exterior sound radiation, 78–85
forced sound pressure response, 59, 147
sound radiation from basic sources and radiators, 75
boundary element method, 3, 257, 268, 277
acoustic transfer vectors, 203
boundary conditions, 180, 189–190, 199–202
boundary maximum principle, 191
boundary method, 183–184
cluster computing, 210–213
commercial packages, 209
condensed acoustic meshes, 213, 221
exterior radiation problems, 202, 220
versus finite elements for fluids, 180
frequency interpolation, 203–205
inputs, 213
interior problems and artificial damping, 195
multipole expansions, 212–213
nonuniqueness/nonexistence difficulties, 191–198
outputs, 213–214
polar coordinate transform, 185
singular integrals, 188
six elements per wavelength rule, 205
solving the equation system, 211
Sommerfeld radiation condition, 80, 183
verification and validation problems, 220–225
Cayley–Hamilton theorem, 484
Champoux–Allard model, 247 see also poroelastic material
characteristic impedance, 93, 242, 245, 249, 253
characteristic lengths, 246–247, 250–251, 253, 254
characteristic size, 250, 253
circular piston, 89–95, 263
coincidence
dip, 108–110
frequency, 99–103, 106–110
collocation method, 316, 323
component mode method, 132–142
structural–acoustic model, 132–133
two coupled cavities, 140–142
two coupled oscillators, 138 see also coupled oscillators
composite, 17–19, 273
compressional waves, 11–12
conductance, 44
coupled acoustic resonance frequency response with closely spaced modes, 123–125
with all structural modes, 127
with structural rigid body mode, 128
coupled-mode modal coefficient, 138
coupled oscillators, 42–48, 138, 324–328
coupled structural–acoustic problem, 180–183
acoustic coupling matrix, 181
acoustic coupling matrix in modal space, 183
added mass approximation, 182, 202–203, 210
conversion from surface pressures to nodal forces, 181
eigenvalues computed using the singular value decomposition, 205
finite element/boundary element, 180–183
mode amplitude vector, 182
radiation damping, 181, 205, 220
state-space eigenvalue solution, 205
uncoupled approximation, 181
using in-vacuo modes as basis functions, 182–183
coupled structural resonance frequency, response with all cavity modes, 127
with closely spaced modes, 123–125
with Helmholtz mode, 126
coupling loss factor, 45, 352, 370 see also Statistical Energy Analysis (SEA)
critical frequency, 106, 112, 237, 262
cylindrical pore (porous material with), 246–247
cylindrical shell, 495–496
dace sheet, 19–20
damped modal frequency, 68
added, 231, 238, 264
cavity (acoustic) modal damping coefficient, 120
constrained layer damping, 37, 231, 235–238
critical damping ratio, 36, 37, 63
design, 235–237
extensional (free) layer, 231, 235–236
layer, 262
damping (cont'd)
  loss factor, 35–39, 231–234, 236, 238–240, 257, 263
  materials, 180–183, 231
  mechanisms, 231, 232, 236
  modal damping constant (decrement), 59, 118–120
  proportional viscous damping, 119
  structural modal damping coefficient, 119
  viscoelastic, 232, 238
  viscous, 249
decoupling, partial, 249
density see effective density
design of experiments (DoE), 308
diffuse acoustic field, 106–107, 237, 258–260, 272, 348
direct field, 344–345
direction cosine matrix, 147
dispersion, 11
curves, 486, 491, 493, 494
relation, 476, 491
dispersive waves, 11, 16
double porosity, 243
double wall, 231, 260, 262
dynamical mechanical analysis (DMA), 234
dynamic stiffness matrix, 473–474, 483, 485, 487, 493, 500
effective bulk modulus, 154, 245–246
effective density, 154, 245–246
effective sound pressure, 154
elastic frame, Biot theory, 249
elastic modulus, 11–13, 240
elastomer testing system, 413
enclosures (rooms)
  acoustic modal response, 60
  flexible and absorbent wall effects, 60–64
  forced sound pressure response, 60–64
  natural frequencies and modes, 56–58
  normal mode method, 59
  random sound pressure response, 67–68
  response at resonances, 64–65
  steady-state sound pressure response, 60–64
  transient sound pressure response, 68–72
energy, 230–232, 236, 238–240
density, 437–438, 440–441
intensity, 437–438, 440–441

steady-state sound pressure response
coupled structural-acoustic system, 162, 411–412
acoustic modal participation, 167
boundary panel participation, 168
structural modal participation, 167, 170
enclosure(room), 60–64
by dominant structural mode, 126
operating engine (powertrain) induced vehicle interior noise, 176, 422–423, 426
at resonances, 64–66
stiffened panel, 20–21, 28
Stochastic Finite Element Method (SFEM), 305, 312, 314, 317–324 see also uncertainty
coupled oscillators, 324–328 see also coupled oscillators
orthotropic plate, 329–333
strain energy, 35, 44–45
stress–strain relations, 232
structural-acoustic
  coupled cavity-tailgate mode and frequency, 161
  coupled resonance frequencies (modal, mass controlled, stiffness controlled), 123–124
  coupled response (structural excitation, acoustic source excitation), 125
  modal coupling, modal amplitudes, 120
  modal response, tube-mass-spring system, 129–132
structural-acoustic optimization
  adjoint operators, 286
  applications, 271
  approximation techniques, 280
  constraints, 273
  multi-objective, 280
  objective functions, 274
  optimization algorithms, 282–284
  parameters, 272
  reanalysis, 288
  sensitivity analysis, 272, 284, 287
  topology, 272
  structural modal response matrix, 412
  structure-borne noise, 8, 174
  subsonic waves, 99–101
  substructuring, 288, 473, 483–484, 486–487, 491, 493, 498
  supersonic waves, 99, 101
  surface method, 318
  symmetry transformation, 486
Taylor series, 281, 285
  temperature effects, 48–49
  thick beams (Timoshenko), 14–15, 473, 476, 477, 493, 494, 497
  thick plates (Mindlin), 15–16, 26–27
  thin beams (Euler–Bernoulli), 14–15, 472, 477, 493, 494
  extension, 359–360
  flexure, 359–360
  torsion, 359–360
  thin plates, 16, 27, 439
  throw-off element, 482–483
time-temperature superposition, 39
  tortuosity, 245–248, 250–254, 262
  Transfer Matrix Method (TMM), 258–267
  element transfer matrix, 484–487, 490
  Transfer Path Analysis (TPA), 407, 426 see also Hybrid Transfer Path Analysis
transient load, 474, 497
transient response, 68–72, 171–174
  direct response, 172
  modal response, 172–173
  sound pressure decay in enclosure, 71
  vehicle interior noise over tar-strip bump, 174
  transmission coefficient, 107, 250–253, 259, 263
turbulent boundary layer (TBL), 272, 462
uncertainty quantification, 305, 308, 309, 324, 335, 342–343, 347–348 see also Stochastic Finite Element (SFEM)
  covariance, 312
  expected value, 310
  Karhunen–Loève Expansion, 305, 309, 313, 396–397
  mean value, 310
  polynomial chaos expansion, 314–317
  probability density function (PDF), 310
  standard deviation, 311
variation
  orthotropic plate vibration, 306
  vehicle interior noise, 176
  vehicle vibration, 343
velocity/speed
  group velocity/speed, 358, 441, 476
  phase velocity/speed, 476
vibrating beam technique, 234–235
vibration power flow, 429–430
vibro-acoustic see also Hybrid Transfer Path Analysis
  measurement set-up, 420
  reciprocity, 409–410, 421
  transfer function, 407, 409, 422, 425
viscoelastic, 37–38, 232, 238
viscoelastic material, 231–239, 265
viscosity, 232, 245, 247, 249, 251, 255
viscous, 36
walls
  absorbent-wall effect on sound pressure response, 60–64
  flexible-wall effect on sound pressure response, 60–64
Wave Finite Element (WFE), 5, 474
waveguide, 472–473, 476, 487, 491, 493
  classical waveguides, 491, 493
  finite waveguide, 480
  periodic waveguide, 484
  waveguide element, 476
wavenumber, 21–22, 90, 436
  acoustic, 237, 241, 243, 245, 250, 259
  bending, 236
  compression, 249
  elastic solid, 245
  poroelastic, 245, 249
  rod, 485, 487
  shear, 237, 249, 255, 256
  Timoshenko beam, 479, 488
wave propagation functions/constants
  general periodic structure, 485–486
  rod, 477, 485
  Timoshenko beam, 479
wave propagation modes
  general periodic structure, 485–486, 489–491
  rod, 475
  Timoshenko beam, 479
wave propagation solution
  explicit wave propagation approach, 480
  implicit wave propagation approach, 481
  Wave Spectral Finite Element Method (WSFEM), 473–474, 491, 493–503
  weighted residual, 145
  Williams–Landel–Ferry (WLF) model, 233–234
  see also damping, viscoelastic
  Young’s modulus, 13, 233, 235, 256–258
  Zhong’s formulation, 487 see also wave propagation modes
