A
Abrasion, investigating etiology of, 273
Adapted centric posture, bite splint therapy and goal of, 39
Adaptive capacity
decrease in, 15
fluctuations in, 15
occlusal stressors and, 14, 14
Aesthetic dentistry, harmony between temporomandibular joints, muscles, occlusion and, 26
Aesthetic examination, 21–26
Aesthetic failure vs. functional failure trade-off, 441
Aesthetic occlusal plane, 105–108
decrease in, 15
occlusal stressors and, 14, 14
Aesthetic occlusal plane, 105–108
desired goal of, 106
device in place for dentist and patient evaluation, 108
device removed from cast, 108
diagnostic corrections made on articulated diagnostic casts, 107
fabrication of, 108
sequencing patient evaluation and approval of changes, 107–108, 108
significant changes in upper incisal edge length, upper aesthetic plane, and profiles of posterior teeth, 108
uneven and asymmetrical profiles of facial surfaces of upper posterior teeth and corrections made with restorations, 106, 107
uneven and irregular, corrections made with definitive restorations, 106, 106
viewing from broader frontal perspective, 106
Aesthetics
clinical examination of masticatory system and, 7, 8
as co-discovery approach, 31
as integral part of comprehensive approach, 21–22
Aesthetics and anterior guidance restoration
close-up anterior retracted photograph of completed restorations, 197
close-up anterior retracted photographs of completed restorations with mandible protruded to anterior end-to-end relationship, 198
close-up occlusal photographs of completed restorations, 198
damage by wear with increasing overbite with upper and lower anterior crowns, 195–198
key points about case, 198
photographs after provisionalization suggesting improved overbite relationship, incisal edge display at rest and functional anterior guidance marks, 197
pretreatment articulated diagnostic casts showing anterior tooth-to-tooth relationship, 197
pretreatment panoramic radiograph suggesting endodontic concerns, 196
pretreatment retracted anterior photograph suggesting anterior and end-to-end functional relationship, 196
pretreatment smile photograph suggesting concerns, 196
putty index made from articulated casts of provisionals and definitive restorations fitting precisely into index, 197
summary of examination and diagnosis, 195
summary of treatment plan, 196
summary of treatment sequence, 196
10 decisions, 195
trial equilibration done until bicuspids coupled, 197
Aesthetics and functional changes
maxillary and mandibular aesthetic and functional reconstruction with lab-processed composite restorations, 204–209
maxillary and mandibular dental reconstruction including 4 dental implants replacing unrestorable teeth, 216–219
maxillary reconstruction at open vertical dimension to improve aesthetics, length, buccal profiles and functional landmarks, 199–203
posterior reconstruction with severe interferences to centric arc of closure, 189–194
restoration of aesthetics and anterior guidance damaged by wear, 195–198
restoration of anterior aesthetics and anterior guidance in deep overbite damaged by bruxism with upper and lower anterior reconstruction, 184–188
restorations maxillary bicuspid-to-bicuspid done first as part of comprehensive plan, 210–215
Aesthetics and functional success
achieving with providing less than optimal information, 442–447
for both arches being restored, 445–446
changing a person from a full denture to implant-supported fixed or fixed removable case, 446–447
for digital impressions, 446
for entire arch being restored, 445
for laboratory soft tissue models, 447
for multiple anterior teeth, 444
for multiple posterior teeth with no solid posterior stop, 444
posterior quadrants on same arch and posterior quadrants opposing each other, 444–445
for single and multiple posterior teeth in same quadrant with solid occlusal contact both anterior and posterior to prepared teeth, 443
for single anterior tooth with solid occlusal contact both anterior and posterior to prepared tooth, 443

Clinical Cases in Restorative & Reconstructive Dentistry
impressions, related bite records, shades, study casts, and tools
for restoring different types of cases for, 442
Aesthetic zone. See also Implants in aesthetic zone
Alumina copings on natural teeth and removable overstructure,
maxillary telescope case, 337–341
Amelogenesis imperfecta
disadvantage with no-provisional approach, 208
key points about case, 209
mandibular impression and cast completed on day 1, 208
maxillary and mandibular aesthetic and functional reconstruction
with lab-processed composite restorations for treating,
204–209
maxillary and mandibular posterior impressions and casts, 208
occlusal and buccal occluded photographs of completed
restorations, 209
pretreatment articulated diagnostic casts and wax-up, 208
pretreatment buccal occluded and occlusal photographs, 206
pretreatment panoramic radiograph, 207
pretreatment photographs showing condition of teeth and
unattractive smile, 206
restorations bonded same day as preparations, 208
smile and retracted anterior photographs of completed
restorations, 209
summary of examination and diagnosis, 204
summary of treatment plan, 205
summary treatment sequence, 205
10 decisions, 204
American Academy of Cosmetic Dentistry, 438
Anterior aesthetics and anterior guidance
articulated putty index of provisional that captured incisal edges
and lingual contours, 188
centric stops and anterior guidance functional markings of
definitive restorations, 188
definitive lower anterior restorations, 188
facial veneers fabricated for upper bicuspid to improve aesthetic
plane, 188
key points about case, 188
lower restorations finalized first, 188
photographs of upper and lower provisional at current vertical
dimension of occlusion, after occlusal refinement, 187
photographs verifying changes made with provisional, 187
pretreatment articulated diagnostic casts, 187
pretreatment panoramic radiograph, 187
pretreatment photographs suggesting wear and aesthetic issues,
185
pretreatment radiographs, left side, 186
pretreatment radiographs, right side, 186
restoration of, in deep overbite damaged by bruxism with upper
and lower anterior reconstruction, 184–188
summary of examination and diagnosis, 184
summary of treatment plan, 185
summary of treatment sequence, 185
10 decisions, 184
upper definitive restorations, 188
wax-up illustrating anterior functional relationship changes, 187
wax-up showing aesthetic changes, 187
Anterior centric holding contacts
deep overbites and, 87
desired morphology of, 49, 49
Anterior centric stops
ideal locations for, 87
labial-incisal line angle of lower contacting marginal ridges of
upper, 88
on lingual of upper anteriors, ideally on marginal ridges, 87, 88
maintaining, if present in maximum intercuspation, 88
morphological design of, 48, 48
not of a stable design, allowing eruption of lower anterior
segment, 89
Anterior guidance, 91–97. See also Anterior aesthetics and anterior
guidance
angle of condylar guidance vs. angle of, 94–95
defined, 91
envelope of function, tooth contours interfering with signs and
symptoms and, 93
good or ideal, 91
key to, 79
lower incisal edge anatomy/position and upper incisal edge
position, 91, 92
lingual surfaces in shallowing case which opened vertical
dimension of occlusion, 96
physiologic occlusion and, 46
refining “edge-to-edge” position and, 96, 97
restoration of damage caused by wear with increasing overbite
with upper and lower anterior crowns, 195–198
shallowing, by opening vertical dimension of occlusion, 96, 96
unique envelope of function, chewing path, phonetic path and, 93
various contours of functional surface on patient-by-patient basis
and, 91, 92
Anterior guidance angle, shallowing, before and after comparisons,
95
Anterior open bite case, vertical dimension of occlusion, 70, 72, 72
Anterior overjet, severe, handled with occlusal/restorative treatment
in lieu of orthognathics
anterio smile and retracted photographs of finished dentistry, 364
definitive restoration designed as smaller fixed partial dentures
and single units rather than a full arch splint, 365
diagnostic wax-up showing several issues, 364
green marks illustrating protrusive that starts on upper first
bicuspid and transitions to cuspids and incisors, 364
key points about case, 365
photos illustrating centric stops in adapted centric posture arc of
closure, 364
posttreatment buccal photographs, 364
pretreatment articulated diagnostic casts suggesting severe
overjet, 362
pretreatment radiographs, 363
red marks illustrating lateral guidance starting on first bicuspid and
transitioning to cuspids, 364
severe Curve of Spee, 362
summary of examination and diagnosis, 360
summary of treatment plan, 361
summary of treatment sequence, 362
10 decisions, 361
Anterior teeth, upper and lower, correct anatomy of, 88
Arch customization
for individual patients, T-Scan III Occlusal Analysis System and,
400
customized patient arch, 400
noncustomized patient arch, 400
Arc of closure, bite splint and interferences to, hyperactivating
positioning muscles, 40–41
Arc of rotation, mandible and, 67
Articulated diagnostic casts, 5, 6, 26–27. See also Diagnostic casts;
Wax-ups
facilitating communication process and, 54
inspection of, 26
purpose of, 26
for severe wear case, 70
Articulating paper, 391
Articulators
choice of, 441
wax-up and, setting condylar inclination on, 52
Auscultation
Doppler sonography in temporomandibular joint examination, 10, 10
temporomandibular joint examination and, 9
Avascular necrosis, past condylar replacement due to, followed by posterior occlusal reconstruction, 166–170
Axial forces, non-axial forces vs., 90

B
Balancing interferences, diagnostic blueprint (wax-up) and, 52
Bar in edentulous space, purpose of, 330
Behavioral decisions, technical decisions, vs., some reasons for, 371
Behavioral skills, importance of, 27
Bibs, tooth shade selection and, 437
Big case, comprehensive case vs., 5
Big picture
seeing, 32
10 decisions and, 63
training eye and mind for, 77
Bilateral simultaneous contacts, measurable, computer-guided occlusal adjustments and, 413, 415
Bimanual guidance
centric relation bite record and use of, 26, 26
condyles, bite splint adjustment and, 40
to superiorly compress the condyles within fossa and test load-bearing status of TMJ, 11, 11
Bi- Manual Manipulation technique, 4-handed centric relation recording with T-Scan III and, 401
BioPAK electromyography system (T-Scan III), 424–425, 428
desktop, 424
illustrating lessening of muscular hyperactivity at end of right excursive movement when posterior teeth are finally discluded, leaving only canine contact, 426
illustrating presence of muscular hyperactivity during right excursive movement, 426
illustrating presence of muscular hyperactivity when right excursive movement commenced by patient presenting with prolonged Disclusion Time, 426
group function during right excursion, 425
patient with EMG leads placed on 8 head and neck muscles, 424
Bite records
accuracy of, 435–436
aesthetic and functional success and, 442
Bite registration material, correct amount of, 436, 436
Bite splints/bite splint therapy, 37, 38–44, 362
anatomy/physiology of masticatory system and design of, 41
behavioral benefits with, 44
bruxism, cusp to fossa angle and, 103
Curve of Wilson facilitates working side disclusion, 43–44
defined and purpose of, 38
goals of, 39
intracapsular and muscle disorder resolved with, 157–161
intracapsular and muscle disorder with resultant occlusal plane asymmetry resolved with, 162–165
intracapsular and muscle pain resolved with, followed by definitive occlusal therapy with posterior reconstruction and anterior composites, 178–181
during laboratory refinement, 43
logical rationale for use of, 38
lower vs. upper, 40
materials for, 39
maxillar or mandibular arch?, 39–40
with no retrusive inclines distalizing condyles, 44
refined, polished, 44
shallow, flat, smooth anterior guidance platform for, 42
splint design and anatomy of masticatory system, 40–44, 41
anterior guidance platform: shallow, flat, and smooth, 42
condyles in most superior position, 40
Curve of Wilson facilitates working side disclusion, 43–44
interferences to arc of closure hyperactivate positioning muscles, 40–41
no retrusive inclines that distalize condyles, 44
posterior exclusive interferences hyperactivate elevator muscles, 41
stable, retentive fit for, 42–43
starting from treatment position, 38–39
temporomandibular disorder resolved with, followed by definitive occlusal therapy, 171–177
Bleaching teeth, restoration shade resolved with, followed by definitive occlusal therapy, 171–177
Bone loss, denture wear and, 446
Breakage
distal extension implant prosthesis and, 418
maxillar and mandibular implant hybrid force management and, 415
Bruxism, 13
cusp to fossa angle and, 103
fatigue typical with, 290
incredible wear and tear on teeth due to, 266
intracapsular and muscular components of TMJ disorder and, 152, 154
occlusal stress and, 14
restoration of anterior aesthetics and anterior guidance in deep overbite damaged by, with upper and lower anterior reconstruction, 184–188
Bruxism and wear reconstruction, 261–273
restoration of worn lower anterior teeth in deep bite without changing other restorations, 262–265
severe wear from parafunctional habits restored with complete reconstruction at increased vertical dimension of occlusion, 266–273

Congenitally missing maxillary incisors

anterior and lateral smile photographs with maxillary lateral incisor provisional abutments and composite corrections made to maxillary central incisors, 305

articulated diagnostic casts prior to debanding done by restorative dentist, 304

commonplace occurrence of, 302

diagnostic corrections completed by adding to distal surfaces of maxillary central incisors, 304

frontal and lateral full face photos, 303

full face photograph, approximately 1 year posttreatment, 306

key points about case, 306

with orthodontics to open lateral incisor space, dental implants and other aesthetic improvements, 302–306

photographs near end of orthodontic treatment, 304

postorthodontic casts illustrating wedge-shaped maxillary central incisors, bulky interdental papilla, and low maxillary frenum attachment, 304

posttreatment anterior and lateral retracted photographs of completed zirconia restorations, 305

posttreatment anterior and lateral smile photographs of definitive restorations, 305

posttreatment radiographs of integrated implants, 305

preparation of maxillary and mandibular occlusal photographs, 303

preparation of panoramic radiograph, 304

progressive panoramic provided by orthodontist to verify correct root angulations and proper spacing for dental implants, 304

retracted anterior and lateral photographs of maxillary lateral provisional restorations, 305

stock abutments prepared extraorally and refined intraorally with composite placed in screw access chamber, 305

summary of examination and diagnosis, 302

summary of treatment plan, 303

summary of treatment sequence, 303

10 decisions, 302

Congenitally missing upper right cusp

anterior and lateral photographs of definitive restorations; pink porcelain used to simulate not only papilla but also marginal gingival, 310

anterior and lateral photographs of provisional restorations, 309

articulated diagnostic casts done by restorative dentist prior to debanding, 309

diagnostic wax-up taken to verify acceptability of proportions of restorations, 309

key points about case, 310

preparation of anterior and lateral retracted photographs; pink porcelain will be needed on papilla, 308

preparation of anterior and lateral smile photographs, 308

preparation of panoramic radiograph, 309

radiograph of implant placed in maxillary right cusp position, 309

retracted photographs of provisional and modified implant abutment; pink composite added to distal of upper right maxillary central incisor and to simulate papilla between abutment and pontic, 309

summary of examination and diagnosis, 307

summary of treatment plan, 308

summary of treatment sequence, 308

10 decisions, 307

upper right lateral incisor lost in accident; implant placed in cusp position, pink porcelain to simulate gingival, 307–310

Continuing education, 433

buccal occluded nearly an orthodontic class 1, 258

buccal occluded photographs showing class 1 posterior occlusal relationship, 260

with chin advancement; prerestorative occlusal therapy with equilibration and composite additions, 256–260

class 1 anterior occlusal relationship, 259

evidence of wear from bruxism, 257

dont points about case, 260

maximum intercuspation looking acceptable at first glance, 257

occlusal photographs showing old restorations on most all posterior teeth, 258

postorthodontics showing even more of a gummy smile as arches were leveled and aligned, 259

postorthognathic panoramic radiograph, 259

postorthognathics showing improved incisal edge display, lessened gummy display, and more pleasing profile, 259

pretreatment frontal and lateral smile photographs showing excessive tooth and gingival display and retracted chin, 257

pretreatment full mouth radiographic series, 258

pretreatment photograph of relaxed lip showing 8 mm of tooth display, 257

pretreatment photographs, 259

smile photograph showing 5 mm of gingival display, 257

summary of examination, 256

summary of treatment plan, 257

summary of treatment sequence, 257

10 decisions, 256

tooth-to-tooth relationship after trial equilibration, 259

upper lip at free margin of gingival in a smile, 259

Maxillary and mandibular resorption, severe

before and after smile photos, 358

clear surgical mandibular stent, which is duplicate of approved diagnostic setup, 357

clear surgical maxillary stent, which is a duplicate of approved diagnostic setup, 357

completed maxillary and mandibular implant-supported bars illustrating maxillary anterior uncovered for unimpeded placement of prosthetic teeth, 358

dentures retained with plastic Hader clips, 358

dont points about case, 358

maxillary bone grafting; maxillary and mandibular implant-supported bar and bar-supported dentures with flanges needed for lip and cheek support, 355–358

photographs after first surgery showing maxillary bone augmentation, 358

pretreatment maxillary CAT scan suggesting very narrow maxillary alveolar process and close proximity to maxillary sinus, 357

pretreatment anterior and lateral smile photographs, 356

pretreatment mandibular CAT scan suggesting adequate bone in anterior mandible but deficient bone in posterior mandible, 357

pretreatment maxillary and mandibular occlusal photos and pretreatment articulated diagnostic casts, 356

soft relined dentures, 358

summary of examination and diagnosis, 355

summary of treatment plan, 356

summary of treatment sequence, 356

10 decisions, 355

Maxillary anterior resorption

significant, keep implants and bars distal to maxillary lateral incisors, 358
significant, keep implants and bars distal to maxillary lateral incisors so as not to interfere with tooth placement and phonetics, 354

Maxillary bar-supported removable partial denture

anterior guidance functional movements, 329
articulated casts of maxillary preparations against mandibular preparations, 327
articulated casts of provisionals, both fixed and removable, 327
articulated casts of provisionals without the removable partial dentures and articulated casts of lower preparations against upper fixed and removable provisionals, 327
design of bar, 329
diagnostic blueprint with corrected lower incisal plane in correct occlusion with upper right cusp, 326
diagnostic blueprint with provisional removable partial dentures, 326
drawing on maxillary and mandibular photographs communicating desired design of fixed and removable aspects to technician, 328
key points about case, 330
lower completed dentistry, 329
lower crowns with semiprecision removable partial denture and, 324–330
mandibular fixed restorations against upper cast of fixed provisionals, 329
mandibular putty index made on cast of lower fixed provisionals without removable provisionals, 328
maxillary and mandibular completed fixed and removable dentistry showing type of predictability routinely achievable, 329
maxillary and mandibular removable frameworks prior to placement of prosthetic teeth, 329
maxillary fixed portion being checked with putty index of maxillary provisional restorations, 329
maxillary removable partial denture with centric stops marked, 329
occlusal photographs of maxillary and mandibular completed dentistry, 329
photograph of trial “facade” with central incisors in center of face, 327
photograph of vacuum-formed index made on cast of upper fixed and removable provisionals, 328
posttreatment panoramic radiograph, 330
pretreatment articulated diagnostic casts mounted in adapted centric posture arc of closure, 326
pretreatment articulated diagnostic casts photographed in maximum intercusption, 326
pretreatment lingual photographs, 326
pretreatment panoramic radiographs, 326
pretreatment photographs of buccal occluded and maxillary and mandibular occlusal, 325
pretreatment photographs of retracted anterior in maximum intercusption and teeth separated, as well as maximum intercusption with current removable partial dentures, 325
putty index made of upper incisal edges and lingual surface made with casts in occlusion, 328
putty index made on maxillary cast of provisionals, which then transfers to casts of preparations, 328
summary of examination and diagnosis, 324
summary of treatment plan, 325
summary of treatment sequence, 325
10 decisions, 324
upper fixed aspect then fabricated against already completed lower restorations, 329

Maxillary bicuspid-to-bicuspid restorations
completed dentistry photographs, 215
first contact in adapted centric posture arc of closure and amount of anterior opening at that point, 213
as first part of comprehensive plan, with maxillary left central incisor implant and other discrepancies corrected with reshaping and equilibration, 210–215
key points about case, 215
pretreatment occlusal photographs and initial radiographs, 212
pretreatment smile and retracted photographs, 211
provisional photographs showing similarity of diagnostic wax-up and provisionals, 214
summary of examination and diagnosis, 210
summary of treatment plan, 211
summary of treatment sequence, 211
10 decisions, 210

Maxillary cast, 26
facebow mounting and, 106, 106

Maxillary central incisor
challenges with failing tooth in aesthetic zone, 290
close-up photographs of changes made to lower anterior teeth, 294
close up photographs of wear and uneven incisal edges, 292
hopeless, transitioned to implant-supported restoration with crowns on remaining incisors along with occlusal therapy, 290–295
key points about case, 295
lateral smile photographs and retracted anterior photographs suggesting uneven incisal edges due to bruxism, 292
photograph at end of first surgical appointment at periodontist office, 294
photograph of new provisionals after implant abutment for 9 was placed, 294
photographs following first treatment appointment which involved equilibration, composite restorations on lower anterior teeth and upper cuspids, provisionals on teeth 7-10, mandibular bite splint, 294
photographs of preparations of teeth 7, 8, 10, and custom abutment for implant number 9, 295
posttreatment photographs of definitive restorations for teeth 7, 8, 9, and 10 suggesting much improved gingival tissues symmetry, 295
posttreatment photographs with teeth apart and also protrusive edge-to-edge position and right and left crossover positions, 295
pretreatment articulated diagnostic casts, 293
pretreatment mandibular occlusal photograph illustrating wear on lower anterior incisal edges, 292
pretreatment microscope view photograph of compromised facial root surface, 293
pretreatment photographs of lingual surfaces of posterior teeth, 292
pretreatment photographs with lip at rest, slight smile, and high smile, 292
pretreatment radiographs of anterior teeth suggesting compromised root integrity of tooth 9, 293
second set of articulated diagnostic casts equilibrated in centric relation arc of closure until there were centric stops to bicuspids, 294
summary of examination and diagnosis, 290
summary of treatment plan, 291
summary of treatment sequence, 291
10 decisions, 291
Maxillary central incisor extracted and replaced with dental implant delayed placement and loading with, 311–312 immediately after provisional cementation, mesial contour ridge needs to extend vertically another 2mm to match left central, 312 key points about case, 312 mesial contours are extended laterally, 312 photograph of the prepared ceramic implant abutment, 312 pretreatment retracted photograph and radiograph; Essex type provisional used, 312 provisional made on cast made from impression of implant abutment, 312 smile and retracted photograph of completed restoration, 312 summary of examination and diagnosis, 311 summary of treatment plan, 312 summary of treatment sequence, 312 10 decisions, 311 Maxillary complete fixed partial denture on 9 Galvano telescopic copings anterior and lateral photographs of definitive dentistry, 389 anterior and lateral retracted photographs illustrating facia margin decay repair, 387 anterior and lateral retracted photographs of definitive dentistry; precise, very thin Galvano telescopic copings do not require bulk in fixed partial denture overstructure; subtle use of pink porcelain, 390 anterior and lateral retracted photographs of provisional restorations, 389 anterior and lateral smile photographs of provisional restorations, 389 buccal occluded and occlusal photographs, 387 Galvano telescopic copings cemented with definitive cement, 389 key points about case, 390 with mandibular anterior fixed partial denture on 4 Galvano copings, 385–390 pretreatment anterior and lateral smile, 386 pretreatment articulated diagnostic casts closed to first contact in adapted centric posture arc of closure, 388 pretreatment radiographs; blade implant and restoration is 20+ years old, 387 summary of examination and diagnosis, 385 summary of treatment plan, 386 summary of treatment sequence, 386 10 decisions, 385 trial equilibration and diagnostic wax-up, 388 Maxillary extensive bone graft followed by implant-supported bar and bar-supported overdenture after bite splint therapy and at vertical dimension of first contact in adapted centric posture arc of closure, 353 anterior retracted photo suggesting uneven incisal plane higher vertically than posterior occlusal plane, 352 completed implant bar-supported maxillary complete denture, 354 completed lower fixed-removable and upper complete denture, 353 denture retained onto implant bar with 4 Hader clips, 354 flange needed for lip support, 350–354 four most recent maxillary prostheses, 352 key points about case, 354 mandibular bite splint made and adjusted over time in arc of closure with condyles seated, 353 maximum intercuspsation after hit and slide, 353 much improved anterior tooth-to-tooth functional relationship, 354 observation of bite splint over time is informative about parafuncional habits, 353 photograph of results of years of dentistry trying to deal with loss of teeth, loss of supporting bone and worsening TMJ disorder, 352 posttreatment panoramic radiograph, 354 pretreatment articulated diagnostic casts, 353 pretreatment panoramic radiograph, 352 six weeks after bone grafts, upper anterior “facade” made for aesthetics only, 353 summary of examination and diagnosis, 350 summary of treatment plan, 351 summary of treatment sequence, 352 10 decisions, 351 upper bone grafts using hip as donor bone were done in posterior maxilla followed by 8 implants, 353 Maxillary extractions, immediate implant placement, and immediate loading anterior and lateral smile photographs and anterior and lateral photographs of completed restoration, 239 anterior retracted photograph about one month postsurgery, 238 with complete nonremovable zirconia restoration with pink porcelain, 237–239 definitive impressions made of implant abutments after they were secured to place; illustration of 14-unit zirconia framework, 239 key points about case, 239 new provisional after definitive implant abutments were placed, 239 postsurgery panoramic radiograph of maxillary dental implants and temporary abutments, 238 pretreatment panoramic radiograph, 238 pretreatment photograph illustrating hopeless maxillary and mandibular dentition, 238 summary of examination and diagnosis, 237 summary of treatment plan, 238 summary of treatment sequence, 238 10 decisions, 237 Maxillary fixed partial denture supported by both teeth and implants along with other maxillary and mandibular implant-supported crowns and tooth-supported crowns and fixed partial dentures, 132–137 anterior retracted and occlusal photos of first provisional restoration, 136 completed upper and lower restorations, 136 design of upper restoration, 136 diagnostic blueprint showing occlusal plane changes and increase in length of central incisors, 136 key points about case, 138 periodontium as maintainly healthy with generalized grade 1 mobility, 135 posttreatment panoramic radiograph showing sinus graft, 137 posttreatment periapicals, 137 preoperative articulated diagnostic casts suggesting occlusal plane issues, 134 preoperative occlusal and buccal photographs, 134 preoperative posterior radiographs showing generalized grade 1 mobility and sinus anatomy, 135 protrusive end-to-end photograph and anterior retracted photograph after provisional modification from upper surgery, 136
seven-year follow-up radiographs, 138
summary of examination and diagnosis, 132
summary of treatment sequence, 134
summary treatment plan, 134
10 decisions, 132
Maxillary fixed partial dentures with precision removable partial denture; mandibular bar-supported complete denture, 331–336
anterior and lateral smile photographs of definitive dentistry showing refined occlusion, 335
completed maxillary dentistry with and without removable partial denture; retention provided with Dawson D 2.7 attachment, 335
definitive maxillary fixed partial dentures and maxillary and mandibular removable restoration, 335
detailed mandibular diagnostic blueprint showing gold copings and bar on remaining three teeth and removable overdenture, 334
detailed maxillary diagnostic blueprint illustrating tooth preparations, provisional fixed restorations and prototype of removable partial denture, 334
key points about case, 336
lower definitive restorations, 334
patient’s current upper and lower all-acrylic removable partial dentures, 333
posttreatment radiographs, 336
pretreatment articulated diagnostic casts and diagnostic blueprint, 334
pretreatment lingual photographs suggesting failing upper restorations, 333
pretreatment occlusal and buccal photographs suggesting vertical dimension and lower tooth position, 333
pretreatment panoramic radiograph, 333
pretreatment smile and retracted photographs suggesting lower incisal plane issues in both vertical and horizontal dimension, 333
summary of examination and diagnosis, 331
summary of treatment plan, 332
summary of treatment sequence, 332
10 decisions, 332
Maxillary implant-supported bar-retained removable partial denture along with tooth-supported restorations to reconstruct occlusion and vertical dimension, 314–318
bar giving partial denture lateral and vertical stability but not retention; this is a Swivel-Loc attachment, 317
buccal view of second diagnostic wax-up, 317
five-year posttreatment panoramic radiograph, 318
flange needed relative to position of anterior teeth to ridge; also position of ridge through vacuum formed index, 316
initial diagnostic wax-up with intent of a nonremovable restoration, 316
key points about case, 318
photograph of integrated implants and nonremovable laser-welded bar, 317
posttreatment anterior and lateral retracted photographs suggesting improved vertical dimension and improved incisal-gingival length of prosthetic teeth, 318
posttreatment anterior and lateral smile photographs, 317
pretreatment articulated diagnostic casts at vertical dimension of first contact in adapted centric posture arc of closure, 316
pretreatment occlusal and buccal photographs, 316
pretreatment panoramic radiograph, 316
pretreatment retracted photographs suggesting lack of interocclusal space, unstable left cuspid-to-cuspid relationship and lower left occlusal plane that is too low anteriorly, 315
pretreatment smile photographs, 315
second diagnostic wax-up illustrating removable approach showing nonremovable bar and removable prosthetics, 317
summary of examination and diagnosis, 314
summary of treatment plan, 315
summary of treatment sequence, 315
10 decisions, 314
Maxillary periodontal-restorative reconstruction improving aesthetics and function before and after mandibular occlusal photos, 281
before and after maxillary occlusal photos, 281
before and after smile photos, 280
diagnostic blueprint showing resorption in edentulous areas of 5 and 6, 279
first set of provisional with finish lines well short of gingival tissues, 280
key points about case, 281
with lower posterior reconstruction following conventional surgery, bone and soft tissue grafts, covering recession, 276–281
photos showing progression from pretreatment to first provisional to definitive restoration, 280
photos taken at periodontist office showing bone graft of resorbed ridge upper right, 280
pretreatment articulated diagnostic casts, 279
pretreatment buccal occluded photographs, 277
pretreatment photographs showing malalignment of teeth, recession of upper anteriors, and resorption of edentulous ridge in upper right, 277
pretreatment radiographs, left side, 279
pretreatment radiographs, right side, 278
second maxillary provisional done after healing of all surgical procedures, 280
solid case and die cast sent to technician, 280
summary of examination and diagnosis, 276
summary of treatment plan, 277
summary of treatment sequence, 277
10 decisions, 276
Maxillary reconstruction at open vertical dimension diagnostic wax-up incorporating aesthetic and functional changes approved with previous step, 202
to improve aesthetics, length, buccal profiles, and functional landmarks, 199–203
key points about case, 203
mirror photographs of maxillary teeth with failing restorations, 200
pretreatment panoramic radiograph suggesting mandibular teeth are structurally acceptable, 201
pretreatment smile and retracted photographs, showing reverse Curve of Wilson and severe Curve of Spee, 200
removable diagnostic provisional made over unaltered maxillary cast, 201
smile and retracted photographs of definitive dentistry, 203
smile and retracted photographs of diagnostic provisional in place, 201
smile and retracted photographs of provisional restorations, 202
summary of examination and diagnosis, 199
summary of treatment plan, 200
summary of treatment sequence, 200
