Monte Carlo simulation 125
optimal power flow (OPF) 125
penalty 133
real-time area coherency iterative algorithm 136
real-time transient stability index (TSI) 125–130
transient unstable case 135
voltage deviation index (VDI) 128–130
voltage vulnerable case 136
vulnerability status 133
vulnerability status prediction method 113

transmission and distribution (T&D) test-system 313
transmission-distribution systems, control of 258, 317
transmission networks (TNs) 41, 42, 49, 53, 54, 58, 60, 312, 334, 341, 392
transmission system operators (TSOs) 22, 25, 34, 161, 258, 318
turbine generators 284

U
ultra-high voltage (UHV) 362
Under-frequency load shedding schemes (UFLS) 339

V
Vapnik–Chervonenkis dimension 110
voltage control
control variables 253
models 251
reference values and voltage limitation 253
system operators 252
voltage source converter (VSC) technology 234
voltage stability
assessment 218–219
definition 217, 395
measurement-based methods 217
model-based methods 217
steady-state voltage stability 395–398
voltage stability constrained optimal power flow (VSCOPF)
optimal control action 217
preventive measure
  problem statement 224–225
  simulation results 225–226
voltage stability margin (VSM) 218, 219
corrective measure
  problem statement 226–227
  simulation results 227–229
volt-var control (VVC) 312
active power modulation 316
algorithm 321–322
countermeasure 318–319
disturbance and voltage restoration
  emergency detection 322–323
  minimum load reduction 317
  reactive power injection 316, 318
  restoration procedure 318
  simulation results and case studies
    emergency support, from distribution
      328–334
    stable scenarios 323–325
    unstable scenarios 326–328
test system 319–321
TN assumption 317
vulnerability assessment
  conventional methods 120
    definition 119
    off-line assessment 3
    on-line assessment 3
oscillatory index (OSI)
  dominant modes 139
  electrical area 139
  electrical signals 137
  fast-phenomena assessment 138
  modal identification technique 141
  mode meters 138
  oscillatory modes 139, 140
  poorly-damped local modes 140
  prony analysis 138
  ringdown methods 138
  threshold damping 139
overload index (OVI)
  branch outages 144
dc-DFs 141
  injection shift factor (ISF) 142
  MC-based simulation 142
  power transfer limit 143
  SDF-based overload estimation 142
  PMU measures 120
  power system actions and operations
    4–5
  power system vulnerability condition 121
  real time assessment 3–4
TVFS vulnerability performance indicators
  39-bus-test system logic schemes
    133–134
  DlgSILENT PowerFactory software 125
  frequency deviation index (FDI) 131
  MATPOWER package 125
  Monte Carlo simulation 125
  optimal power flow (OPF) 125
  real-time area coherency iterative algorithm 136
  real-time transient stability index (TSI)
    125–130
  transient unstable case 135
  voltage deviation index (VDI)
    128–130
  voltage vulnerable case 136
  vulnerability status 133
vulnerability symptoms
  oscillatorystability 6–7
  post-contingency overloads 7–8
  rotor angle stability 6
  short-term frequency stability 7
  short-term voltage stability 7
  transient stability 6
vulnerable area 119
vulnerable system 1, 2, 119

W
Western System Coordinating Council (WSCC) 3-Machine 9-Bus test system 370
wide area monitoring, control, and protection (WAMPAC) system 357, 389
wide area monitoring systems (WAMS)
  10–12, 120
  Campus WAMS 88–89
wide area monitoring systems (WAMS)  
(continued)  
dominant oscillation mode  88  
DVA  
characteristic ellipsoid (CELL) method  13  
data mining-based framework  14  
Monte Carlo methods  14  
phase-space visualization  14  
PMU data  13, 16  
random-forest (RF) learning  15  
short time Fourier transform (STFT)  14  
support vector regressor (SVR)  14  
verge of collapse state  15  
EMD results  89–90  
extracted oscillation mode  91–92  
Hilbert marginal spectrum (HMS)
