historical overview 268–271, 272
  particle size-selective criteria for 255–287
  tracheobronchial and alveolar aerosol fractions 276–278
fine dust method 115
fine and ultrafine particles, efficiency of 266
flow patterns 16, 17
flow rate 524–526
  flow control 525
  flow measurement 525–526
flow separation 18, 19
flow stability 84–86
flow through screens, deposition by diffusion in 212, 213
flows, separation and reattachment 18, 19
fluid mechanics 13–22
  boundary layers 16–18
  equations of fluid motion 13–15
  potential flow 20
  stagnation 18, 19
  streamlines and streamsurfaces 15–16
  turbulence 20–22
fluidised-bed generators 55–56, 57
fluorescence technology 511–512
fluorescent aerodynamic particle sizer (FLAPS) 511
fly ash 4
foam media 198
  calculated penetration 201
  nominal porosity 200
  penetration of a cylindrical plug of porous plastic foam media 199
forward-scattering instrument 499
freestream turbulence, effects on aerosol samplers 90
frequency distribution, particle size distribution 6
friction velocity 178
Froude number \((Fr)\) 26
full-shift true breathing zone sampler 351
fumes 4
  suggested factors to convert personal exposures to ‘total’ aerosol 545
Gathercole model 554
geometric diameter 4
geometric standard deviation (GSD) 64, 65
granular bed filters 527
Gravicon 328
gravimetric dust sampler, 2.5 Lpm MRE (Mines Research Establishment) Type 113A 166
gravimetric mass sampling 558–559
gravimetric methods
  analysis of collected samples 534
  EPA guidelines 534
gravimetric samplers
  for inhalable aerosol 317
  for respirable fraction 316–317
  for total aerosol 313–314, 317
gravitational deposition of particles 175, 177
gravity angle 185
greases 533
Greenberg–Smith impinger 362, 363
GS-1 conductive plastic cyclone 374
GS-3 respirable dust cyclone 370, 372
hard rock mining, respirable aerosol exposures in 552–554
Harvard impactor, field comparisons for side-by-side reference sampler for PM10 and chosen ‘local’ samplers for PM10 587, 588
HAZ-DUST 1 497, 498
‘Hazard’ device 489
Health and Safety Executive (UK), occupation exposure limits 294
helmet-mounted personal samplers 351
Hering low pressure impactor 457
Hexhlet horizontal elutriator-based respirable aerosol sampler 364, 365
Hi-Vol sampler for PM10 434, 436
Higgins–Dewell sampler 373, 374, 558
Hirst spore trap 479
horizontal dust deposit gauges 418, 576, 577
horizontal elutriation 195–197
  idealised uniform flow 196
  penetration of rectangular horizontal elutriator 197
  realistic parabolic laminar flow 196
horizontal elutriator-based 2.5 Lpm MRE static
  respirable aerosol sampler 367
horizontal elutriators 316, 364–368, 448–450
horizontal thin-walled probes 146
hot processes, suggested factors to convert personal
  exposures to ‘total’ aerosol 545
human head, aspiration efficiency of the see aspiration
efficiency, of the human head
human health, risk of aerosols to 222
human respiratory tract 223–225
  alveolar region 289
  diseases of 290–291
  extrathoracic region 289
  regions of and deposition of inhalation particles
    during inspiration and expiration 256, 257
  regions of 289
  tracheobronchial region 289
  ‘Hurricane’ sampler 554
hybrid systems, bioaerosol monitoring 512–513
idealised test aerosols 50–52
impaction 28–30
  aerosol particle size selection after
    aspiration 205–211
  conventional 205–208
  low pressure and micro-orifice 209
  virtual 209–211
impaction efficiency 29
  for aerosol sampling 98
  for an aspirating thin-walled cylindrical sampling
    tube 98, 99
  for an aspirating thin-walled cylindrical sampling
    tube from experiments using direct method by
    Belyaev and Levin 101
  for an aspirating thin-walled tube facing the
    freestream
    comparison between the experimental data of
      Zenker and the theoretical calculations of
      Volushchuck and Levin and Rüping 112
    comparison between the theoretical calculations of
      Vitols and Belyaev and Levin 111
impaction models
  for a blunt sampler facing the freestream 116–120
  for orientations other than forward-facing 105–109
  for a thin-walled tube facing the freestream
    96–98
impactor-based sampling heads, for collecting fine
  atmospheric aerosol fractions 433
impactors
  2 Lpm multi-orifice-size respirable aerosol 377
  multi-orifice-size parallel impactor 376, 377
  respirable fraction samplers 376–377
  single-stage 478–481
  thoracic fractions samplers 387–388
  impingers 314, 361–362, 363, 482–483, 484
  in-stack sampling probe 410
  incident plane 9
indirect method 36–37, 60, 102
inertial samplers
  bioaerosol samplers 477–484
  impingers 314, 361–362, 363, 482–483, 484
  passive samplers 478
  single-stage impactors 478–481
inertial spectrometers 450–451, 452
inhalability 249
  at very low wind speeds 244–247
  early experimental measurements of 237–241
  Armbruster and Breuer 238, 239
  Ogden 238, 239
  Vincent and Mark 239, 240
  experimental studies 237–247
  later experimental results for aspiration efficiency of
    human head for various wind speeds 240, 241
  physical basis of 241–242
  for very large particles 242–244
inhalability curves
  for calm air 251
  showing original ISO curve and the original ACGIH
    curve 249
  for various wind speeds 251
inhalable aerosol
  personal samplers for coarse aerosol
    fractions 344–351
  relationship between ‘total’ aerosol and 539–549
  sampling for total suspended particulate in the
    ambient atmosphere 431–432
  side-by-side comparative studies of ‘total’ aerosol
    and 540–547
  static samplers for coarse aerosol fractions
    328–333
inhaled aerosol exposure concentrations, example of
  the history in a large nickel smelter from 1960
  to 1979 557
inhaled aerosol exposures, in the nickel
  industry 554–558
inhaled aerosol samplers, analysis of performance
  data for 352–354
inhaled fraction 252–253, 317
  criteria for 248, 249–251
inhalation 223
inhalation experiments 259
inlet sampling efficiency 476
INSPEC inertial aerosol spectrometer 451, 452
instrumentation, aerosol sampling 228, 309–515
instruments
  direct-reading 322, 489–515
  stack-monitoring 415
optical aerosol-measuring instruments 490–503
interception 30
INTERCOMP2000 study 593, 594
interferences to aerosol sampling after
  aspiration 173–188
in complicated systems 186
deposition inside thin-walled tube at orientations
  other than forwards-facing 184–185
deposition losses
  inside a bent sampling tube 180–181
  inside a straight sampling tube 173–179, 180
  inside a thin-walled tube facing into the
  wind 181–184
electrostatic effects 186–188
rebound of particles from internal walls 185–186
interferences to aerosol sampling during
  aspiration 157–173
electrostatic forces 162–164, 165
external wall effects 165–173
turbulence 158–162
intermediate conditions 152–154
intersampler comparisons, summary of locations 585, 586
'inverted Frisbee' deposit gauge 420, 421, 576, 577
IOM 2 Lpm personal inhalable aerosol sampler 344, 345, 486
  performance in calm air 345, 346
  performance in slowly moving air 346, 347
  performance for various windspeeds 345, 346
IOM 3 Lpm static inhalable aerosol sampler 330–332
  complete assembled instrument 331
  performance of 332
  sampling head 331
IOM 30 Lpm sampler 431, 432
IOM personal inhalable aerosol samplers 379, 530, 540, 541
  comparison between workers’ exposures to
  airborne dust as measured using 541, 543
  airborne lead as measured using 541, 542
  overall airborne dust as measured using 541, 542
  scaling relationships for the modified, low flow rate
  version 350
  summary of LOD and LOQ for different
  combinations of filter and cassette 531
IOM personal inhalable dust spectrometer (PIDS),
  cumulative particle size distributions obtained
  using 565
IOM static inhalable dust spectrometer (SIDS) 458
  isokinetic sampling 74, 114–116, 237
Johannesburg curve 269
konimeters 312, 314, 360, 361, 552–554
  comparison between standardised konimeter counts
  and respirable silica concentration 555
  field comparisons between four different
  models 553
Kuile, Ter 148–149
layer efficiency 198
lead, exposure to aerosols containing 291
Levin, aspiration efficiency of a point sink in calm
  air 139–140
light attenuation-based monitors in stack sampling,
  single-pass and two-pass 493
light extinction 491
light scattering 491
light scattering photometry 494–498
limit of detection (LOD) 60, 529, 530–531
limit of quantification (LOQ) 60, 529, 531
limit values 289–307
  aerosol-related health effects 289–292
  ambient atmospheric aerosol limits 297–301
  bioaerosols 303
  fibrous aerosols 302–303
  for nonhealth-related aerosols 300–302
  occupational exposure limits (OELs) 292–297
  standards setting 292
  ultrafine aerosols 304–305
limiting trajectory 28–29
line and point sink samplers 71–72
Litton large volume electrostatic air sampler
  (LVAS) 486
Liu–Pui inlets 433, 435, 436
living environments, framework for aerosol sampling
  in 221–235
log-normal particle size distribution 6
long-running thermal precipitator (LRTP) 315, 362, 550
lung diseases, associated with exposure to
  bioaerosols 303
lung, the, summary of morphological and physiological
  data for 224
Maddox sampler (aeroconiscope) 477
Marple personal cascade impactor 460–461, 462, 563
  eight-stage 481, 482
  set of typical cumulative particle size distributions using 564
Marple-type miniature eight-stage cascade impactor 559
Marple-type personal cascade impactors 533
mass balances 506–508
mass measurement 505–509
mass median aerodynamic diameter (MMAD) 6, 64, 65
mass number index (MNI) 551
  relationships with other aspects of airborne dust in coal mines 552
mass stability, collection media 528–531
maximum exposure limit (MEL) 294
Maxwell, James Clerk 491
mechanical mobility 22
membrane filters 527
mesothelioma 302
meteorological sampling 440–442
metering dust generator 55, 56
method of tangents 503
micro impinger 483
micro-orifice impactors 209
micro-orifice uniform deposit impactor (MOUDI) 457, 458, 461
midget impinger 314, 361–362, 483
mine dust sampling, cotton-wool filters 313
Mini-Ram light scattering based instrument 561
Miquel sampler 479
Mist 4
  suggested factors to convert personal exposures to ‘total’ aerosol 545
MMAD (mass median aerodynamic diameter) 6, 64, 65
Model 3040 diffusion battery 467
modified Andersen MK-II nonviable sampler 457
molecular diffusion 30–32
MOUDI, 2 Lpm personal sampler 457, 458, 461
mouth breathing 256, 275
moving air 40–45
  near a point sink, particle trajectories for 110
  streamline patterns 72
MPG II, 46 Lpm (sampler) 364
MRE respirable dust sampler 364, 367, 550
  comparison between output from two direct-reading optical instruments and respirable aerosol measured gravimetrically using the 561
MRE Type 113A horizontal elutriator-based static respirable aerosol sampler 366
multi-inlet respirable aerosol sampler 372
multi-orifice-size parallel impactor 376
  penetration as function of particle aerodynamic diameter 377
multi-stage liquid impinger (MSLI) 483
multiple-jet single-stage impactors 480
Nano-MOUDI 457
Nanometer Aerosol Sampler (NAS) 439, 440
nasal deposition, calculated results for efficiency 276
National Ambient Air Quality Standards (NAAQS) 298, 299
NBS dust feeder 55, 56
next generation pharmaceutical impactor (NGI) 459, 460
nickel industry, inhalable aerosol exposures in 554–558
nicotinamide adenine dinucleotide phosphate [NAD(P)H] 511
nonculturable organisms 474, 475
nonviable organisms 474
nose breathing 256

retrospective exposure assessment 311
Reuter centrifugal sampler (RCS) 485
Reynolds, Osborne, Sir 21
Reynolds number ($Re$) 15, 16, 18, 21
rotameter 525
rotary vane pumps 520, 521
rotating-table generators 53–54, 55
Rotorod sampler 428, 429, 478
Royco instruments 499

saddle point 132
Safety in Mines Light Scattering Instrument
(SIMSLIN) 367, 495, 561
Saffman lift force 175, 176
sample equilibrium system (SES) 588
samplers
field experience for respirable aerosol 558–562
line and point sink 71–72
performance characteristics 9–12
rebound of particles from external surfaces of 168
for ’total’ and inhalable bioaerosol 486
samplers with circular slit inlet, effect of freestream
turbulence on 162
samplers for the respirable fraction 359–385
cyclones 368–375
early samplers 360–364
horizontal elutriators 364–368
impactors 376–377
porous plastic foam filter samplers 378–383
sampling for ‘respirable’ fibers 385
samplers for the thoracic fractions 385–391
cyclones 386–387
impactors 387–388
porous plastic foam filter samplers 388–391
vertical elutriators 386, 387
samples
analysis of collected 533–535
handling and transport 533–534
sampling
for black smoke 423–425
to measure aerosol particle size
distribution 317–318
sampling for aerosols in the ambient
atmosphere 417–445
black smoke 423–425
course ‘nuisance’ aerosols 417–423
fine aerosol fractions 432–440
meteorological sampling 440–442
total suspended particulate 425–432
sampling for bioaerosols see bioaerosol sampling
sampling for coarse aerosols in workplaces 327–358
analysis of performance data for inhalable aerosol
samplers 352–354
passive aerosol samplers 354–356
personal samplers 333–351
static (or area) samplers for coarse aerosol
fractions 327–333
sampling for the determination of particle size
distribution 447–472
aerosol spectrometers 448–451, 452
cascade impactors 452–465
cascade cyclones 466–467
cascade impactors 452–465
diffusion batteries 467–469
microscopy 469–470
parallel impactors 465–466
rationale 447–448
sampling efficiency 359
sampling for fine aerosol fractions in the ambient
atmosphere 432–440
PM$_{2.5}$ 435–438, 439
PM$_{10}$ 432–434
ultrafine aerosols 439–440
sampling for fine aerosol fractions in
workplaces 359–402
PM$_{2.5}$ 391–393
respirable fraction 359–385
simultaneous sampling for more than one aerosol
fraction 395–398
thoracic fraction 385–391
thoracic particle size selection for fibrous
aerosols 393–394
very fine aerosols 394–395
sampling heads, performance of 435
sampling in perfectly calm air 131–149
experimental studies for 135–138
qualitative description 131–134
sampling plane 9
sampling probes for stack sampling 410–414
dilution 413–414
null-type probes 411, 412
self-compensating probes 412–413
standard probes 410–411
velocity-sensing probes 411
sampling for ‘respirable’ fibers 385
sampling in stacks and ducts 403–416
basic considerations 403–404
direct-reading stack-monitoring instruments 415
sampling for determining particle size distribution in
stacks 414–415
sampling probes for stack sampling 410–414
stack sampling methods 404–409
sampling for total suspended particulate in the ambient
atmosphere 425–432
inhalable aerosol 431–432
total aerosol 425–430
sampling train 407, 408, 409
sampling tubes
deposition losses inside bent 180–181
deposition losses inside straight 173–179, 180
penetration of particles 187
sampling for very fine aerosols
combustion-related aerosols 394–395
ultrafine aerosols 394
scanning differential mobility analyzer (DMA) 504
seven-hole personal sampler 335–336, 545
sharp-cut cyclone (SCC) 438, 439
short-term exposure limits (STELs) 294
sieve samplers 480
silicone grease 533
SIMGARD sampler 364
SIMPEDS sampler 373, 387
SIMSLIN (Safety in Mines Light Scattering
Instrument) 367, 495, 561
single-hole personal sampler 335
measured sampling error as function of wind speed
for dry fused alumina dust particles of various
mean size 171
single-jet impactor 205–206, 207
measured sampling error as function of wind speed
for dry fused alumina dust particles of various
mean size 171
single-jet impactor 205–206, 207
single-stage impactors, inertial samplers 478–481
Sioutas personal cascade impactor sampler 461, 463
slip 23–24
slit-type impactor 479
slowly moving air 48–50
aspiration in 149–154
smog 320–321
smoke 4
smokes, suggested factors to convert personal exposures to 'total' aerosol 545
spectrometers see aerosol spectrometers
spherical blunt samplers
air flow about 86–89
in calm air, aspiration efficiency for 139
trajectories of particles near 137
see also blunt samplers; cylindrical blunt samplers;
disk-shaped blunt samplers
spinning disk aerosol generator 51–52
splash fragments 103
split-flow electrostatic elutriator 503
spray 4
stack sampling
cascade impactors for 462, 463
sampling probes for 410–414
in the UK and elsewhere 409
in the USA 405–409
determination of particulate matter emissions from stationary sources 407–408
determination of PM10 emissions 408
sample and velocity traverses for stationary sources 406
sample and velocity traverses for stationary sources with small stacks or ducts 407
stack sampling methods 404–409
stacks
direct-reading stack-monitoring instruments 415
and ducts, sampling in 403–416
sampling for determining particle size distribution in 414–415
stagnation 18–19, 86, 87, 88
standard thermal precipitator (STP) 315, 362, 363, 550
standards
for aerosols 219–308
definition 222
for bioaerosols 474
