and condensate losses, 389
condensate discharge, 391
condensate return, 392
monitoring steam losses, 393
recommendations, 392
steam recovery, 392
steam trap management, 389–391
minimize generation cost, 387, 389
process steam, usage and energy cost allocation, 394–396

Boilers, 329, 330
blowdown, 332
combustion efficiency, 387
efficiency, 332, 370, 410
feed water (BFW), 17, 403, 426
fire-tube boiler, 330
loading optimization, 405
modeling, 332–333
packaged boiler, 332
specific fuel consumption, 370
steam (See Boiler steam)
water-tube boiler, 330–331
Boiler steam
  cost breakdown for, 370
  cost components contributing to, 367
  specific costs calculations, 367
  specific total cost $C_{ST}$, 367–368
  steam system configuration, 369
  variable and fixed costs, 368–370
Bottom temperature, 314
Brainstorming, 150
  acknowledgement, 152
  discussion platform, 151–152
  expected attendees, 150–151
  ground rules, 152
  time duration, 152
BFW. See Boiler, feed water (BFW)
Building process simulation, 287–288
Capital and energy trade-off, 164
Capital cost, 32, 148, 152, 160, 194, 216, 427
  estimates, 8, 173, 189
  incremental, 441, 445
  minimum, 176, 307, 464, 477, 491
  modifications, 6
  of heat exchanger network, 162, 163
  selection, 180
Capital project management, 499
Case studies, 165–166
  advanced technology projects, 490
  applying retrofit method to total site, 193–194
  cost and benefit analysis, for process unit, 491
  diesel hydrotreating process, 165–166
  benefit estimation, 168–169
  selection of a representative operation basis for targeting assessment, 166–167
  energy reduction for 5-year implementation plan, 492
  energy-saving opportunities, 489
  delayed coker unit improvements, 490
  hydrocracking unit (HGU) improvements, 490
  reforming unit energy-saving opportunities, 489–490
  increase feed rate for crude unit, 183–188
  overcome limitations, for implementing energy modification projects, 191–193
  reduce energy cost for DHT unit, 188–190
  retrofit cases for shifting bottlenecks
  retrofit project for a refiner, 477–478
  retrofit project for ethylene plant, 478–479
  site-wide energy optimization strategy, 487
  identify inexpensive improvement options, 488–489

capital cost estimates, 467–468
economic analysis, 468–470
fuel prices, uncertainty of, 466–467
justification of improvement options, 466
OSBL costs, 470–471
steam prices selection, 467
Pump-around rates, 308
Realistic capital costs, 172
Reboiling optimization, 302
Reflux rate optimization, 301–302
Reflux ratio, 36, 203, 307, 316, 317, 499
Relax plant constraints, 472–473
Retrofit Project
ethylene plant, 478–479
for refiner, 477–478
Revamp feasibility assessment
false balances, identification, 474–475
fuel gas long, 475–477
key parameters and their interactions, 473–474
rigorous process/equipment simulations, 459
scope and stages, 460
feasibility scoping study, 460–461
feasibility study, 461
retrofit design phase, 461–462
Setting operating pressure, 317–318
Setting operating targets, 315–317
with column bottom temperature, 314–315
Simulation, 33, 172
basis, 128
building process simulation model, 287–288, 411
building steam balance simulation model, 418
calculation of distillation efficiency, 292
determine isentropic efficiency, 338
relationship correlations, 47, 309
effective percentage of flash, 193
loading changes for the steam system, 405
mathematical modeling, 418
maximum reboiler duty, and tower pressure, 322
model conducted for two naphtha splitters, 214
model for DIP, 320–321
model, verified and revised against, 47
Monte Carlo simulation, 449, 451–452, 456
operation at higher pressure, 326
predictive process simulation model, 479
purpose of process simulation, 463–464
regression analysis, 57
results at designed reboiler duty, 321
software, 120
standardized, 129
tower pressure based on, 54
tower rating assessment, 298–300
to verify fidelity, 282
Site-wide energy optimization strategy, 482
case study, 487
crude and vacuum unit, 488–489
cost and benefit analysis, 491
effective energy use via optimizing operation, 482–484
energy-saving opportunities
advanced technology projects, 490
delayed coker unit improvements, 490
hydrocracking unit improvements, 490
reforming unit energy-saving opportunities, 489–490
high capital investment via process changes and advanced technology, 484–485
low capital investment via increased heat recovery, 484
minimize waste and losses via diligence, 482
utilities optimization for reduced energy generation cost, 485–487
INDEX
Statistics summary, for normal
distribution, 456
central tendency, 456
mean, 456
median, 456
confidence intervals for the true
mean, 457–458
skewness, 457
standard deviation, 456–457
standard error, 457
Steam balance, 345
bottom-up methodology for, 352
calculate missing flows, 352, 353
balance convergence, 356–357
daerator balance, 355
HP header balance, 354
MP header balance, 354
LP header balance, 354
steam system PFD with unknown
flows, 352
guidelines for generation, 346
practical example for generating, 357
daerator balance, 360
HP header balance, 357–358
MP header balance, 359
LP header balance, 359–360
solving for unknowns, 360–362
top–down methodology, 348
calculate and revise the balances,
351–352
calculate missing flows, 348
daerator balance, 350
develop a steam system PFD with
unknown flows, 348
HP header balance, 348–349
LP header balance, 349
solving for unknowns, 350–351
verification, 362
control valve, 362–363
steam turbine, 363–364
working example for generation,
347–348
Steam desuperheater, 341–342
Steam distribution losses, 344
Steam equipment efficiency, and limits, 406
Steam flash drum, 342
Steam flash recovery, 329
Steam letdowns and venting,
minimization, 412–413
FD fan, electrically driven, 413
installing new turbine generator, 413
to prevent loss of valuable
condensate, 413
Steam losses, 5, 144, 347, 386, 392, 402, 418, 482
Steam optimization, 403
