Index

A
Absolute maximum moment, 350–352
Accuracy of calculations, 7–8
Adjoint matrix, 523
Allowable stress design (ASD), 15–16
American Association of State Highway and Transportation Officials (AASHTO), 39
American Concrete Institute (ACI), 16
American Concrete Institute (ACI) moment coefficients, 318–320
American Institute of Steel Construction (AISC), 16
American Railway Engineering Association (AREA), 40
American Society of Civil Engineers (ASCE), 14, 39
Angle changes, see Deflections
Approximate analysis
ACI coefficients, 318–320
advantages, 316–317
building frames, 320–323, 325–329
cantilever method, 328–329
continuous beams, 318–320
equivalent frame method, 320
exact methods compared to, 316–317, 329–330
lateral loads on buildings, 325–329
points of inflection (PI), 320–321
portal frames, 323–325
portal method, 326–327
statically indeterminate structures, 316–334
structural analysis using, 243
stiffness of truss diagonals, 317–318
trusses, 317–318, 330
vertical loads on buildings, 320–323
Vierendeel “truss,” 330
Arches, three-hinged, 100–103
Archimedes, 3
ASCE-7 loads, 14
ASCE 7-16 information, 494–498
Axial deformation, 213–214, 217, 228
Axial force (N)
building frame analysis of, 327, 328
center of gravity (cg) for, 328
columns, 327, 328
defined, 115
degree of freedom (DOF) for, 400–402, 405
direct stiffness (matrix) method for, 400–405
equations of, 117–120
inclined members, 401–405
stiffness matrix for members, 400–405
Axial force diagrams, 128–129
Axial release, 478–479
B
Baltimore truss, 154
Basic principles of structural analysis, 5
Beam elements
analysis of, 425–428
defined, 422
degrees of freedom (DOF), 422–423, 434–435
direct stiffness (matrix) method for, 421–441
displacement notation, 431
fixed-end forces (FEF), 434–435, 449, 465–468
member end forces, 428–431
plotting deflections, 431–434
shape functions, 431–434
shear, moment, and deflection diagrams, 438–441
statical equivalency, 434–438
stiffness matrix for, 421–425
superposition for, 431–432, 438–441
Beams
absolute maximum bending moment, 350–352
angle changes and deflections of, 217–220
approximate analysis of, 318–320
cantilevered structures, 96–99
centerline, 350–351
connections, 84–85
consistent distortions method for, 244–251, 253–258
continuous, 239–240, 254–256, 318–320
curvature, 349–350
curvature of a segment, 196–197
defined, 50
double integration of, 200–202
elastic beam theory, 195–197
fixed-end moments (FEM), 280, 288–289
girders, 353–354
free-body diagrams (FBD), 90–91, 97
influence lines (IL) for, 337–352, 365–374
internal releases, 85–86, 342
line diagrams for, 47
live load placement, 374–375
maximum bending moment, 349–350
maximum deflection, 240
moment-distribution method for, 278–294
panelized diaphragms using, 70–71
point of inflection (PI), 196–197
procedures for analysis of, 197, 218, 245–246
proportion for reactions, 91
qualitative influence lines for, 341–346, 370–374
reactions and, 83–88, 91–92, 96–99, 103–105
SAP2000 computer applications, 104–105, 202–204, 229–258
sign conventions, 115, 279
simple, 337–339
simple ends, 288–289
single redundant, 244–252
sketching deflections, 191–193, 342
spandrel, 320
statical determinacy of, 86–88
statically determinate, 337–352
statically indeterminate, 365–374
stiffness factors (k), 280–281, 288–289
structural use of, 6
support settlement and, 241, 254–256
supports and connections for, 83–85, 342
temperature change effects on, 241, 465–468
tributary area, 50–52
two more redundants, 253–254
virtual work method for, 217–220
Bending moment diagrams, also see moment diagrams, visual integration using, 221–222
Bending moments (M) absolute maximum, 350–352
beam curvature and, 349–350
defined, 115
equations of, 117–120
girder design simplification and, 135–136
influence lines (IL) for, 338–339, 349–352
maximum, 239–240, 349–350
moving loads, 350–352
relationships between load, shear, and, 120–121
sign conventions for, 338–339
Bernoulli, Johann, 212
Blast loads, 41
Boundary conditions (BC) double integration use of, 197–199
structural analysis and, 242
Bowstring truss, 152
Braced diaphragms, 70–71
Braced frames, 68, 69–70
Bridges cantilever erection, 241
components, 6
deck, 153
floor systems, 352–354
highway loads, 39–40
influence line (IL) for, 350–352
live (traffic) loads, 39–40
moving loads on, 350–352
railroad loads, 40
through, 153
trusses, 6, 153–154
Building codes, 13
Building frames approximate analysis of, 320–323, 325–329
assumptions for, 326
cantilever method, 328–329
column axial forces, 327, 328–329
column moments and shears, 327, 329
girder moments and shears, 327, 328–329
lateral loads on, 325–329
moment diagrams for, 327
points of inflection (PI), 320–321
portal method for, 326–327
vertical loads on, 320–323
Building material weight, 19
Buildings, seismic (earthquake) loads and, 14, 33–38
C
Calculation accuracy, 7–8
Camber, 189
Cantilever erection, 241
Cantilever beam method of superposition, 133–134
Cantilever method, frame analysis using, 328–329
Cantilevered structures, 96–99
Carryover factor, see Carryover moments
Carryover moments (CM), 281–282

springs, 85–86
Conservation of energy principle, 211–212
Consistent displacements, 242, 244
Consistent distortions method. See also Flexibility method and force methods of analysis beams, 244–251, 253–258
compatibility equation for, 245
Consistent distortions method (continued)
- composite structures, 266–270
- flexibility structure, 245, 262–263
- frames, 244–246, 251–254
- Maxwell’s law of reciprocal deflections, 252–253
- primary structure, 244–245
- procedures for, 245–246, 264–265
- redundant force, 245
- redundant structure, 244–245
- single redundant, 244–252
- structural analysis using, 242, 244
- support settlement and, 254–256
- temperature changes and, 270–271
- trusses, 262–277
- two or more redundants, 253–254
- virtual work for finding deflections, 252, 262–263, 270–271

Continuous beams and structures
- ACI moment coefficients for, 318–320
- approximate analysis of, 318–320
- consistent distortions method for, 253–256
- equivalent frame method, 320
- influence lines for, 374–375
- live load placement, 374–375
- maximum bending moments in, 239–240
- moment envelopes for, 320
- statical indeterminacy of, 239–240
- support settlements, 254–256

Cooper, T., 40
Coordinate systems
- conversion of, 403–405
- direct stiffness (matrix) method, 391, 401, 403–405, 408–409, 442–443
- double integration selection of, 198–199
- global, 391, 401
- inclined axial force truss members, 401, 403–405
- inclined frame elements, 442–443
- local, 391, 401
- member end forces, 408–409
- transformation matrix for, 403–405, 442–443

Creep in concrete, 189
Cross, H., 4, 278, 373
Curvature, maximum bending moment from, 349–350
Curvature of a beam segment, 196–197
Curved-chord (nonparallel) trusses, 153, 357

D
Dead loads, 14, 18–20
Deck bridge, 153
Deflection diagrams, 438–441
Deflections, 187–236
- angle changes and, 217–220
- beam elements, 431–434
- conservation of energy and, 211–212
- direct stiffness (matrix) method, 431–434
- displacement notation, 431
- double integration, 188, 197–202
- elastic beam theory, 195–197
- elastic deformation from, 187
- energy methods, 211
- frames, 193–194, 217–220
- geometric methods, 187–188
- importance of computation of, 188–189
- long term, 189
- maximum bending moments, 239–240

Maxwell’s law of reciprocal, 252–253
piecewise integration, 218
plotting, 431–434
procedures for, 190, 197, 214, 218
qualitative sketches, 189–194
reaction direction from, 189, 194–195
reasons for computing, 188–189
rigidity and, 240
SAP2000 computer applications, 202–204, 228–229
shape functions for, 431–434
shear deformation considerations, 227–228
springs, 225–227
trusses, 213–217, 262–263
virtual work method, 188, 211–236, 262–263
Deformation. See also Deflections
- axial, 213–214, 217, 228
due to shear, 227–228
elastic, 187
flexibility method equations for, 383–384
force–deformation relations, 242
Degree of freedom (DOF)
- axial force members, 400–402, 405
- beam elements, 422–423, 434–435
- defined, 390
- fixed-end forces (FEF) at, 434–435, 437
- inclined supports, 481–482
- internal releases, 479
- joint types and positions, 390, 394
- kinematic determinacy and, 392, 394
- member end forces, 409
- notation for, 390, 396
- procedure for, 392
- reactions at, 394–395
- restrained, 396
- static condensation of, 470–474
- statically equivalent loads, 434–435
- stiffness matrix development and, 396–398
- transformation matrix representation, 405
- unrestrained, 394, 396
Degree of translation, 298–299, 308–309
Derivative relationships for load, shear, and moments, 120–121
Design, 1–10. See also Structural analysis
