aluminium-zinc-oxide electrodes 304–6
AMOLED displays see OLED
amorphous materials, types of 47–8
amorphous silicon 145–7
Arylite™ 106
atomic layer deposition (ALD) 282–5, 290–2, 295, 305
bias stress 311–13
BPhen layer 302
Brody, Peter 146
buffer layers 301–3, 352–5
Burstein–Moss shift 2, 11–12

C12A7 see nanoporous calcium aluminate
cadmium oxide
electronic properties 2–5, 35
substitutional doping 6–8
cadmium-indium-antimony-oxide 132–3
cesium carbonate 356–9
cage conduction band 22–3, 44, 45
calcium aluminate see nanoporous calcium aluminate
carbon nanotubes 79–80, 185–6, 328
chemical doping 188–9, 196, 201–3
chirality and bond structure 186–7
electrical properties 193, 201–3
sheet resistance and transport 193–6, 198–9
temperature-dependent effects 203–5
morphology 196–8
network deposition 188
optical properties 189–91, 198–9
optical constants 192–3
transparency 191–2
separated carbon nanotubes 200–3, 204–5
synthesis and purification 187

TCO properties compared 199–200
carrier generation
  oxygen reduction 8–10
  substitutional doping 5–8
carrier localization 20–2
carrier transport design 33–5
cavity conduction band 22–3, 44, 45
cellulose paper FETs 171–4
cesium carbonate 356–9
chalcogenides 36–40, 65, 68, 76–9
channel materials 309–11
chemical warfare agents 430–3, 438–9
chemoresistive sensing see gas sensors
clahrated ions 41–2
complex oxides 20–3
copper aluminates see delaffosites
copper(I)oxides 56, 69–72
Cu₃TaS₄ 79
Cu₃TaSe₄ 79
defect doping see oxygen vacancy
delafossites 31, 68, 69–72, 133
crystal structure 70
deposition methods 114–16, 153–4
  for carbon nanotubes 188
  for gate dielectrics 280, 281–5
  see also solution-processed electronics
dielectrics see gate dielectrics
dimethyl methylphosphonate 431–3, 438–9
dopants and doping 1, 5–8, 34–5
  of carbon nanotubes 188–9
  p-type semiconductors 65–7
  qualitative TCO doping model 113
  transition metal 10–12
  see also oxygen vacancy
driver circuits 317–19
E Ink display 216–17

effective mass see electron effective mass
electro-optic modulators, organic
applications and background 373–4
RF photonics 375
conventional modulator structures 375–8
RF propagation loss 379–80
RF velocity mismatch 380–1
TCO modification 378–9
modulator structures based on TCOs 382
basic design structures 384–9
lowest voltage and lowest switching regions 389
material requirements 382–3
RF loss/impedance and velocity matching 390–2
transmission line/full design analysis 392–3
frequency response/switching voltage 396–7
full electro optic-modulator structure 394–5
metal electrodes width 396
metallic-transmission-line-in-air analysis 393–4
substrate dielectric effect 395–6
TCO modulator fabricated and characterized 397–8
electrochromics
applications and benefits 325–6, 336–7
device design and materials 327–9
flexible devices 330–2
long term durability 335–6
research developments
contrast ratio 332–3
transmittance 332
UV irradiation 333–4
electrodes, transparent
electro-optic modulators 373–4
OLED displays 300–4
polymer solar cells 344–55
electron beam evaporation 114–15
electron effective mass 3, 4–5
carrier transport design 33–4
electron localization 20–2
electronic glue 359–62
electronic paper 213–14
applications 214
demands and benefits 214–15
IGZO TFT array 219–21

gallium oxide 18, 20
gallium-indium-zinc-oxide see indium-gallium
gallium-zinc-oxide 157
gas sensors 417–19
background principles 418–20
mechanism of nanowire sensing 427–8
chemical warfare agents 430–3, 438–9
indium oxide nanowires
chemoresistive sensing 436–7, 438–9
synthesis of nanostructures 424–6
transistor devices 437–8
tin oxide nanowires
chemoresistive sensing 428–30, 430–3
optical sensing/photoluminescence 435–6
synthesis of nanostructures 420–4
gate dielectrics 279–81
deposition methods 281–5, 290
on flexible plastics 287–92
