Index

italic used for figures, bold for tables

A
Africa, tropical, climate and hydrology fluctuation during the Quaternary 268
changes driven by Milankovitch forcing 268
Agassiz megalake
depth of incision following drainage to Mississippi River 151, 153
last meltwater discharge to Mississippi River 150
massive subglacial outburst 68
overflow/spill points 67
union with glacial Lake Ojibway 68
Aldan Shield 225, 226
alluvial architecture of large river systems, variability in 7, 17–21
fan–interfan setting 19, 20
interfluvies 19, 20–1
longitudinal trunk systems 11, 12, 18–20, 18
radial fans 18, 20
alluvial stratigraphy, controls on development within the basin 17
Amazon Basin
axial graben, tectonics of may affect modern river alignment 122, 124–5
characteristics 116–17, 118
the Andes 116
Basin centre, Tertiary and Quaternary sands and silts 116
collisional setting but other long-term effects 116–17
extent of tidal influence 116, 117
Guiana and Brazilian shields 116, 119, 121
Holocene floodplain 116, 118
mountain valleys, transition to meandering streams 116, 118
tributary-mouth lakes 116, 118, 121, 136
different river types 45–6
fracture patterns 121–5
alignment of lower River Negro 121–2
drainage networks reflecting deep basement fracturing 118, 121
gravity anomalies 122, 124–5
tilted fault block recognized 122
transfer zones 122, 123, 124–5
neotectonic deformation, effects on river alignments 122, 123, 139
percentage of sediment sourced from the Andes 46
secondary scale of tectonics affecting the river 117, 120, 121
evidence of tectonic deformation 121, 139
formations in basins pinch out near structural highs 120, 121
Gurupá Arch 117, 121
Iquitos Arch 117, 121
Jutaí Arch 117, 121, 126, 128
Monte Alegre Intrusion 117, 121, 122, 126
Purus Arch 117, 121, 122, 126, 128, 139
sediment transport, effects of variation in channel gradients and floodplain widths 126
tectonic construction 117, 119
tectonic setting 139
Amazon delta 78, 79
accumulation rates in subaqueous delta 86
multiple distributaries and islands 85
Amazon River 17, 31, 32–3, 102, 638
Amazon Cone (deep-sea fan) 117, 138–9
development 138
Upper Levee Complex (ULC) 138–9
Amazon Cooperation Treaty 572
association between channel gradient variations and channel and floodplain character 126, 128–30
anabranches common 126
bends less sinuous and longer downstream from the Negro 126, 129–30
dense network of floodplain channels 126
scalloped terrace edges 126, 129
straightened channel courses 126, 128
Basin straddles the Equator, effects 32
channel, position and alignment influenced by deep geologic structures 124–5, 132
controls on modern position of valley 117, 124–5, 139
drainage and sediment transport, gradual escape eastward 119

Large Rivers: Geomorphology and Management, Edited by A. Gupta
© 2007 John Wiley & Sons, Ltd
dry phases suggested in Brazilian and Ecuadorian rainforest regions 32
estimate of mainstem incision during LGM 116
floodplain channel density and width 126
and floodplain, influence of sea-level changes 135–9
average vertical accretion at the coast 130, 138
during the LGM 136–7
most accumulation on the delta plain 130, 138
sedimentation 138
floodplain, modern incomplete sedimentation of 129, 130, 138
SRTM data used for analysis 537, 539, 541
transition to estuary 130, 132
wider, and lakes 129, 132
gemorphology 125–6, 127–31, 132
foreland basin, tectonic deformation and development of terrace sequences 118, 125–6
large exchanges of sediment between channel and floodplain 125
sediment supplies, difference in estimates for different time periods 125
going to sea 57–9
Andean sediment transported northwest round Cabo Norte 58–9
in Orinoco delta region 59, 59
Holocene floodplain of the mainstem 116, 118, 119, 124–5
sediment deposition since sea-level began to rise 137–8, 137
increase in lakes downstream from Iquitos 127, 132
influences of climate change 132–5
large floodplain 31
major river still functioning as it did historically 40
massive avulsion of main channel 122, 123
mean annual precipitation variable across Basin 32
Middle Miocene drainage course 119
modern discharge, most generated in lowlands 135
MODIS data for surface sediment concentrations 544, 545
plate tectonics set fundamental characteristics 117, 119
sediment storage in lowermost valley 57
deposition of new sediment 53, 57
suspended sediment discharge at Óbidos 57
setting 49–52
ancestral river probably flowed westward 49
derivation of suspended sediment and fresh water 51–2, 53
flows between Guyana and Brazilian Shields 49, 52
sediment load measured at Óbidos 49, 51
still free from recognizable anthropogenic influence 115
storage and remobilization of floodplain sediment 52–6
destruction of floodplains by bank erosion 54
detailed view of 55, 56
implications for fates of sediment transported contaminants 56
lack of engineering helps understanding of processes 56
residence time in the floodplains 53, 54
sediment quantity involved in channel-floodplain exchanges 53, 54, 55
várzea, floodplains of Andean-derived sediment 52, 53, 54
structural control 2–3, 11
subtle impacts of tectonics on the landscape 132
suspended sediment load 91
valley underlain by deep east–west trending sag 117, 119, 120
water-surface elevation, gradient and discharge 543, 543
when crossing a structural high 126, 128
Amazon River, modern lithologic and tectonic influences 117–32
first-order Basin-scale influences 117, 119–21
fracture patterns 121–5
second-order transverse structures 121
structural influences on geomorphology 125–6, 132, 139
sand body formed by 100
Anabar Shield 225
Andean orogeny, altered structural character of entire Amazon Basin 121, 139
Andes examples of catastrophic-scale sediment production 46
Miocene uplift 116, 117, 117, 118, 119
source of fluvial sediments, and sediment storage 45–7
and Sub-Andes, supplying sediment to the Amazon Basin 119
Angara Shield 11
annual hydrograph, average Nile River 482, 482
strong seasonal peak 30–1, 33–4
Appalachian Basin, Kentucky interfluve surfaces, finer grained with palaeosol-bearing facies 106–7
multi-storey fluvial sandstone bodies 106
Asia 15
deltas investigation of 87
progradation 88, 88
east and southeast, large rivers of 32, 38–9
seasonally or perennially barotropic climates 31, 38
evolution of large river systems 8–9
freshwater, availability and quality of a concern 609
serious problems regarding some rivers 91
southern, all parts affected by monsoon driver 24
spillways and megalakes forming a temporary river 70, 70, 72
Assam Plains 381
active deformation of 379
anthropogenic activities, contributing to flooding 379
braided channel of Brahmaputra 382
devastating floods 378
still tectonically active 382
various flood control measures 379, 380
Aswan High Dam 263, 622
amount of discharge reaching the delta 279
anticipated impact on hydrology and sediment loads a concern 519
18 years after completion small maximum degradation 519, 521
armouring 521
coarse deposits underlie fine alluvial deposits 521
some water level lowering as far North as the Assiut Barrage 519, 521
effects of construction 484
impounds Lake Nasser 483
suspended sediment dynamics downstream from 283–4, 285
clay-sized material now major particulate fraction transported downstream 283
mean flux of suspended sediment passing through 283
trap efficiency of 282
Atchafalaya River 166, 167
capture of lower Mississippi River likely 152, 161, 162
Red and Ouachita rivers flow into 162
Australia 576
eastern, Upper Permian, thick sandstone- and conglomerate-dominated bodies 104–5, 104, 106
Bowen–Gunnedah–Sydney Basin System 105
previous interpretations 104–5
shown to belong to large meandering rivers 105
Landcare programme 577–8
River Murray Commission 571–2
replaced by Murray-Darling Basin Commission (MDBC) 572, 575
Upper Permian Moranbah and German Creek Coal Measures 107, 108
see also Murray-Darling Basin; Murray-Darling River
avulsion
Amazon River 122, 123
Brahmaputra-Jamuna River 399, 401, 402, 404, 414
Huanghe (Yellow River) Delta 89, 89
Lena River 230
Mississippi River 153, 161, 162
Willamette River 503, 504, 505
B
Baghmati alluvial plains, north Bihar 20
baroclinic vs. barotropic atmospheric conditions 29
bars and bar complexes, Jamuna River 407–13
braid bars 102, 411, 412, 445, 447
point bars 102–3, 241
Bengal Basin
deepening of 398
large magnitude earthquakes 398 and relative sea-level change 24
Bengal deep-sea fan 91, 347
sediment transport to 23
Black Sea
during the last glaciation 70
lower level during glacial times 254
main influx to 70
Blue Nile 287, 476
age hard to estimate 267–8
annual precipitation 483
and Atbara Basin 277–8, 476–7
climate and hydrology and the summer monsoon 277
deforestation, triggered soil erosion 282
Ethiopian headwaters, accelerated soil erosion 281–2
extensive areas of fan deposits 276, 278
Khashm el Griba Dam 281
main mechanisms influencing precipitation mechanics 277–8
major uplift, late Eocene 477
runoff from dominates Nile downstream from Khartoum 277, 277
storage losses to sedimentation 288
summer flood dominates Nile suspended sediment flux 280–1
catchment area 278
early Holocene, geomorphology summarized 270, 273
flood peak late August–early September 278
flows from Ethiopian Highlands 10, 13, 276, 277, 483
Highlands strongly dissected 278
generates lower Nile flood 35
Gezira fan complex (formation) 276, 278, 477
perched palaeochannels 269, 273
Gezira triangle 483
Late Pleistocene flood waters 269, 270
much of path structurally controlled 477
orographic rainfall associated with Indian Monsoon 477
reduced flows between Roseires and Khartoum 483
Roseires Dam 483
falling capacity due to sedimentation 281
suspended load 483
Bonneville Flood 66
Bonneville, Lake, palaeolake 66
Brahmaputra Basin
annual precipitation 377–8
seasonality of 377
contrasting climatic and hydrologic zones 377
control of physical and chemical weathering 389–91
chemical control over weathering 390, 391
controls over erosion rates and their variability 389
physical and chemical erosion rates high 391
runoff not only control over erosion 390
geological and climatic zones, contrasting 374–5
is pristine 373
outside Tibet, three seasons 377
tracing sediments in 382
weathering and erosions rates 373
Brahmaputra River 38, 102, 537, 538, 539, 540
becomes Brahmaputra in plains of Assam 374
characteristics of the channel 381–2
characteristics in the plains 382
variation in slope 376, 381
discharge decreased during LGM 38
dominated by monsoonal precipitation 37–8
intensified during early Holocene monsoon 38
Brahmaputra river system 373–91
bed load and weathering intensity 389
chemical weathering and erosion 386–9
Cenozoic global cooling 388
regional and global effects 373
silicate weathering 388–9, 391
silicate weathering rates and CO2 consumption for whole system 389, 389, 390
water chemistry 387–8, 387, 388
erosion and weathering 382–6
downstream variation of Sr, Nd and O isotope composition 383, 385, 385
Eastern Syntaxis Zone primary sediment contributor 385–6
isotopic compositions of sediments 382, 383–4
sediment and solutes, large quantities move oceanwards 382
flows along Indus-Tsangpo Suture 374
geology of the basin 375–7
Eastern Syntaxis 376, 385–6, 390
high plateau of Tibet 375–6
Himalaya mountains 376–7
Indo-Myanmar and Naga-Patkoi ranges (southern drainage) 377
Mishmi Hills (eastern drainage) 376
plains of Assam and Bangladesh 377
hydrology 377–8
discharge figures, Brahmaputra and main tributaries 378, 378
rainfall main source of water 378
sediment yield/erosion rate, various zones 386
individual zonal rates 386, 386, 386
isostatic rebound and intense, focused erosion in Eastern Syntaxis Zone 386
summary of long profile and cumulative discharge 374, 376
Brahmaputra-Jamuna River 395–430
applied geomorphology and engineering 423–7, 429
Bangabandhu Bridge 423–4, 424–5
bank erosion due to toe scour 423, 423
Brahmaputra Right Embankment (BRE) 423
effect of channel changes since 2002 424
Pabna Irrigation and Rural Development 426–7, 428, 429
prediction of how channel may evolve and change 426, 427
protective concrete embankment, Siraganj 424, 425, 426, 426
requires continual river engineering management 424
bars
common types 410–11
evolution of 411, 413, 413
frequently found attached to islands 407, 410
mid-channel bars 411, 413
sand braid-bar growth 411, 412
subsurface investigation by Ground-Penetrating Radar 102
bedform ‘classification’ 100
bedform types and dynamics 405–13
bed load, important in bedform creation 405, 406
large-scale bedforms 407–13
small-scale bedforms 405–7, 406, 408, 409, 410, 411
bifurcations, offakes and confl uences 413–14
bifurcation migration 413
channel abandonment as function of bifurcation angle 413, 413
channel confl uences, important sites of bed scour 414, 415, 416
channel offakes, significant during avulsion 414
Gorai offake study 414
catastrophic flooding, possible influences on 297
channel scale morphology and historical course changes 399–404
dramatic course changes, past 250 years 399, 400–1
possible avulsion 399, 401, 402
theories for triggering course change 399, 401
westward movement of Jamuna braidbelt 401, 403–4, 403
development of bankline curvature in the large-scale planform 403–4
initial planform after 1770–1830 avulsion 404
development of large-scale infrastructure within Bangladesh 397
dunes
large and macroturbulence 407, 411
smaller-scale bedforms (sand dunes) 405–6, 406, 408, 409, 410
Flood Action Plan 427, 429
floodplain sedimentation 414–18
important controls on local sedimentation rates 418
inundation and sedimentation, important for crop planning 414, 415, 418, 418
key role in controlling sediment yield to the ocean 418
net floodplain erosion 403
soil forming processes, east to west changes 414–15, 417
types of relief in Jamuna floodplain 414, 417
hydrolgy, sediment yield and channel size 398–9
Jamuna River hydrograph 398, 399
Padma River, highest sediment discharge 397
predominantly a braided river 398–9
changes in braiding intensity 404
the river 395–7
1998 flood, devastation caused by 395, 397
Bangladesh Flood Action Plan 397
grain size in 399
hope of predicting and understanding channel movement 397
increased intensity of flood damage 395
nodal points 404
rural economy relies on annual ‘normal’ floods 395
sedimentation, basinal setting and controls on 397–8
control of uplift and subsidence clear 398
controls by ‘fluvial loading’ 398
deepening of Bengal Basin 398
Jamuna River developed in region of significant tectonic activity 397–8
sedimentology of the Jamuna River 418–23
model of bar-top sedimentation 422–3, 422
seven styles of deposition found 418, 421, 422
use of ground penetrating radar and trench/core logging 418, 419–20
Teesta River as a tributary, date 404
Burdekin River
Ground-Penetrating Radar surveys over point bars 102–3
internal architecture of sand-dominated sector 103
last glacial lowstand channel 106
C
Caspian Sea, spilling through the Manych spillway 70
catastrophic glacial dam outbreaks 151, 495
Central Asian mountains, cataclysmic floods 70–1
Chuja-Kurai ice-dammed lake 70
Lake Baikal 71
Lake Issyk-Kul, an even larger ice-dammed lake 70–1
emplacement of outwash fan, mouth of Boam Canyon 70–1
Tuva palaeo-floods 70
Changjiang 9, 39, 102, See also Yangtze
dam construction 39
drainage at meeting point of India and Pacific monsoons 39
lower Basin affected by flow regulation and water transfer 39
serious problems from human activities 91
Changjiang Delta 82, 85
boreholes show increase in delta front progradation 90
evolution of distributary channels important 82, 89–90, 89
evolution reflects sea-level changes 87
not affected by avulsion 89
progradation of 39
sand-mud couplets in 85
sediment accumulation rates 87
channel geometry analysis technique, Lower Mississippi River 553–69
analytical approach and methodology 560–3
channel geometry analysis, parameter calculations 560–1
probability analysis 561, 562
spatial analysis 561, 563
temporal analysis 563

period of plate collision and marginal deformation 301
central Congo Basin, geology and geomorphology 299–300
Congo Lake hypothesis 299
deepened by epeirogenic crustal movement and later deformation 299
Permian coal forming gymnosperm imprints 299
rainforest-covered basin centre since aridity during the LGM 299–300
sediments mainly Carboniferous to Permain or Mesozoic 299
Congo fan core suggests time for major discharge pulse 35
Congo mouth and the submarine canyon 306–7
canyon deeply incised into the continental shelf 306, 306
early hypothesis 306–7
gravity based processes suggested 307
possible tectonic origin 307
possibly initiated by turbidity currents 307
course 293–9
complex sources 293
evolution of 302–3
Congo-Lualaba, bends in wide curve crossing the Equator twice 302
course alteration probably initiated at Miocene–Pliocene transition 302
hypothesis, palaeo-Congo partly followed current Asande Rise drainage 297, 302
Proto-Congo, original drainage from South to North 302
reaching the Atlantic for the second time 302–3
flow regime 303
certain long-term records available 303
determination of seasonal runoff pattern 303
mean annual discharge 303, 305
two flow regimes depending on geographical location 303
gleology and geomorphology of the basin 299–301
and its economic importance 307–8
Democratic Republic of Congo a potentially rich country 307
economic use locally restricted by falls and rapids 307
hydropower facility at Inga Falls 307
importance of railways 307
Matadi–Kinshasa section a major barrier 307
lower course
becomes tidal at Boma 299
crosses Atlantic Rise 299
deep sea fan and submarine canyon extend into the river mouth 299
descends in three-stage section of falls and rapids to Matadi 299
Matadi to the Atlantic, part of an estuarine coast 299
middle course
crosses savanna-covered Batéké Plateau 298
Kasai River joins at Kwamoth 298
large tributaries substantially increase discharge 298
Malebo Pool, Brazzaville and Kinshasa sited on stepped terraces either side 298, 298
natural national border between Brazzaville and Kinshasa 293
rise of the slave trade 293
rises on western shoulder of East African Rift 10
seasonal migration of ITCZ and mean annual precipitation 34–5
solid, suspended and dissolved load 303–6
early estimates not systematically determined 303
an exceptionally clean system 306, 308
most of dissolved load silica or bicarbonate 306
organic content high 305
regular measurements 1987–1992, total fluvial and solute output 305
traditional migration pathway for centuries 293
upper course, Congo-Lualaba
c character change with added
discharge 296
further tributary, Lukuga River
296
influenced by warping and
faulting, Bukama to
Kisangani 294, 294, 297
Kisangani marks end of the
upper course 298
Luvua River, source in northern
Zambia 294, 296

diminishing mangrove forest 342, 343

Index

environmental change 342
diminishing mangrove forest 342, 343
evolution of 335–6
  followed course along Indus-Tsangpo Suture Zone 336, 344
Katwaz Delta 336
large-scale capture of Punjabi tributaries 336
larger changes seen near mouth 336
one of oldest documented rivers 335
five major tributaries, of great importance to agriculture 335
flow in basin now extensively altered 36
Indus Basin Irrigation System (IBIS) 33
the Indus dolphins 341–2
initiation probably after Indian–Eurasian Plate collision 333
lifeline for country’s economy and culture 334
precipitation and streamflow highly variable and seasonal 36
seasonal and annual river flows highly variable 333
source lies in Tibet 333, 335
submarine Indus system 338–9
upper Indus
  a braided stream interrupted by gorges 335
  source of large quantities of sediment 335
water management 339–41
  construction of barrages and canals 339–40, 340
  ecology in lower Sindh and coastal areas affected 340–1
engineered structures affect water discharge 341, 342
engineering structures reduce sediment load 340
ground water contribution to irrigation falling 339–40
high irrigated to rain-fed land ratio 339
mangrove system degraded 340, 345

problems of waterlogging and salinity 340
sea water intrusion 340, 340, 343, 344
variation in below Kotri 341, 341
Indus Submarine Fan 333
Indus-Tsangpo Suture Zone 336, 344, 374, 375, 376
industrialization, late, advantage of 582
integrated water resource management (IWRM) 576
interfl uves 19, 20–1
discontinuities recognizable by palaeosols in coastal plains 20
Intertropical Convergence Zone (ITCZ) 29, 32, 34–5, 38, 319
cyclical migration of and past wetter periods 480
White Nile Basin 477
and hydroclimatology of the Amazon Basin 131, 132
isostatic rebound 386

data and methods for measuring historical channel change 501–3
measuring rates and styles of channel change 502–3
development of 2-D flood model 503
early settlement (1850–1895) 498–9
avoidance of floodplains 498–9
Corps of Engineers began channelization of river 498, 499
floodplain lands increasingly used for agriculture 499
riparian logging 499
steam boat transportation required snagging 499, 499
early work emphasized role of humans on channel change 492
flood history 498, 500–1, 501
extreme events 500, 501
flood control dams lessened flood magnitudes 498, 501
peak flows associated with rain-on-snow events 500
gеological setting in relation to channel stability 495–7
bank height also controlled by geological features 497
flood basalts form local uplands 495
flows against older, more indurated margins 497, 497
Holocene floodplain 497, 497
Missoula Floods 495
other resistant units locally important 497
Pleistocene, braided rivers 495, 496
regional incision and anastomosing planform, Holocene 497
Tertiary marine sandstones form valley basement 495, 496
on historical channel change 507–13
dam construction limited size of winter floods 511
extending lessons learned to other large rivers 511–13
historical channel maps 501–2, 502
and aerial photos, channel defined 502, 511
McKenzie Reach, rapidly migrating bends 1930–50s 501
interpreting historical channel change (1850–95) 508–11, 513
frequent moderate floods and accelerated lateral migration 501, 507, 508, 510
impact of large magnitude floods mid-late nineteenth century 504, 508, 508, 509
increased channel stability and incision 500, 510–11
rapid migration rates and presence of erodible banks 507, 510
results compared against natural and anthropogenic impacts 493, 508
timing of human settlement and avulsion to lateral migration shift 498, 519
Long Tom Reach (1850–1955) 501, 506
net decrease in channel width and length 504, 506
lower and middle Willamette, no significant channel change 1932–1995 period 501
McKenzie Reach (1850–1995) 501, 503–6
1850–1895, increase in channel width, 11 avulsions 503, 504, 505
1895–1932, narrowing as lateral migration became dominant 503, 504, 505
1972–1995 channel change more subtle 504, 506
evolution by migration 503, 504
patterns and controls on historic channel changes 503–7
flood model results 507
percentage of resistant banks increased 507, 507
summary of channel change (1850–1955) 506–7
Santiam Reach (1850–1995) 501, 506
always dominated by lateral migration 506
followed similar trends to other reaches 506
a series of geomorphologically distinct reaches 402
study length delineation 497–8
Long Tom Reach 496, 497
McKenzie Reach 496, 497
Santiam Reach 496, 497–8
timeline and consequences of Euro-American interaction with the river 498–501, 498
development of the Oregon Trail 498
post-development and continued change (1972–1995) 500
twentieth century channel changes 504, 506
urbanization, development and dam construction 500
increase in rate and extent of bank stabilization 500, 500
watershed physiography and climate 495
flood results from rain-on-snow events 495
planform varies over the river length 495
situation 492, 495
Y
Yangtze Delta, modern estuary saltwater intrusion earlier and for longer 622
recession of wetlands in east 621
sediment discharge below maintenance level 615, 621
Yangtze estuary, major sediment sink 466–7
delta plain, seaward prograding tidal flats 467
tidal currents in 466
present progradation rate augmented by reclamation 467
Yangtze River basin geology and landforms 457–60
complex variety of geological units 457, 458
landforms of the eastern Tibetan Plateau 457, 459, 460
major faults trending NW–SE 457
Yangtze River, climatic and anthropogenic impacts on water and sediment discharges 609–24
anthropogenic impacts 619–21
dam construction, reducing sediment transport 616, 619
lake reclamation 612, 619–20, 620
water consumption 615, 619
channel erosion downstream of dams 621
climatic impacts 613, 614, 614, 616–19, 618
decrease in evapotranspiration in sub-basin South 617–18
heavy human impact of water consumption 616–17
precipitation, key role in eroding and transporting sediment 614, 618–19, 618
runoff decrease greater than precipitation decline, sub-basin North 614, 618
runoff increased more than precipitation, sub-basin South 614, 614

data and methods 611
monthly precipitation data 611, 611
water and suspended sediment discharges 611
Dongting Lake 467, 612, 619–20, 620, 620, 624
future change and coastal responses 615, 621–2
impact of dam building upstream from Three Gorges Dam 621
reduction of nutrient supply, decrease in primary production 621–2
sediment load 613, 615, 620, 621
water discharge 621
physical setting 610
mean annual precipitation increases downstream 610, 611
South–North Water Diversion Project 468, 621

Yenisey River 11, 39–40
discharge peaks 40
drainage reversal due to glaciation 14

Z
Zaire River see Congo River
Zambezi River 311–31, 346–7
cultural and economic aspects 330
drainage evolution and speciation 311, 328–30
dambos, focus of major speciation 328
endemism in lechwe 328–9
formation of wetlands by river piracy 329
hotspot of biodiversity and endemic species 328
radiation of cryptophilic plants (geoxylic suffrutices) 329–30

See also Changjiang; Lower Yangtze; Middle Yangtze; Three Gorges Dam, Changjiang (Yangtze); Upper Yangtze; Yangtze estuary

Spatial variations of water and sediment 611–13
annual sediment discharges, decline since 1980s 614–15, 615
division into sub-basins 611, 612
runoff controlled by precipitation 611, 612
sediment discharge 611, 612, 613
temporal annual variations of sediment 614–15, 615, 616
of water (precipitation and runoff) 613, 614, 614, 615
temporal monthly variations 615–16, 617
sediment discharges 616, 617
strong seasonal pattern 615, 616
water discharges 615–16, 617
water discharge, no significant change over last fifty years 619
Yangtze Soil and Water Conservation Project 610
Yellow River 622
impact from dams amplified by decreasing precipitation 609

Younger Dryas 133

Aridity in the Amazon Basin 134–5

Yukon River 11, 40
discharge peaks 40
drainage reversal due to glaciation 14

Z
some determinants of species richness and endemism 329
suffrutesces tracked dambo formation 329
Upper Zambezi Basin, at centre of Zambezian phytochorion 328
ecological impact of major dams 311, 320–1
human and ecological costs 320
Kariba and Cahora Bassa dams, economic benefits 320, 320
major wetlands providing important wildlife refuges 313, 320
severe ecological impacts on major floodplains 320–1
hydrology 317–20
cumulative annual flow 317, 317, 318, 319
effects of movement of climatic boundaries 319
influence of water exploitation, dams 317, 318, 319
mean monthly flows, Upper Zambezi 319, 319
Victoria Falls, records of water level 318, 319–20
increasing human demands 330
link between geological, ecological and evolutionary processes 330–1
three major segments 311, 312, 313
tsetse fly and human occupation 311
pesticides and environmental impact 331
water type mapping on floodplains 546, 547
Zambezi River system 10, 35, 311, 312, 313–17
development of 22

realtime_321–8
Barotse floodplain linked to tectonic uplift 327, 329–30
broad sequence of evolutionary changes postulated 321–8
Chambeshi River 322, 327
complex Pleistocene drainage reorganization 315, 323, 325–6
continental doming over mantle plumes 324–5
Cuando floodplain, probable tectonic origin 327
deep incision of Cahora Bassa Gorge 325
early Cretaceous proto-Zambezi-Limpopo drainage 321, 322, 325
early Stone Age site, floor of Makgadikgadi Pans 326
evidence for major changes in the system geometry 321
Kafue River 321, 326–7
Lake Palaeo-Makgadikgadi 322, 323, 324, 326
Lake Patrick 326–7
lower Cretaceous Zambezi-Limpopo River 323–4
Luangwa River 321, 323
Machili River and Basin 231, 323
Makgadikgadi Pans, lacustrine deposits link into Machili Basin 324, 325–6
modern distribution patterns of certain fish, tigerfish 327–8, 327
Okavango-Kalahari-Zimbabwe (OKZ) Axis, effects of 322, 325
re-established of link to Indian Ocean 322, 325
significance of ferricrete bar across the Zambezi 326, 327
timing of Upper Zambezi capture not well constrained 325
lower Zambezi 316–17
coastline has highest tidal range on the continent 316–17
course controlled by major rift faulting 324
Cuando River 317, 326
floodplain-delta system below Shire confluence 316, 316
intensive agriculture on rich alluvial soils 317
Kafue River, links with Mana Pools Basin 313, 317
Luangwa River 313, 317
Marromeu Game Reserve 317
Mulonga-Matabele Plain 313, 317
middle Zambezi
Batoka Gorge 314, 315, 326
Cahora Bassa gorge 316
characterized by a steeper gradient 314, 315
Chimamba Rapids 315, 316, 326
flows through Kariba, Mana Pools and Chicoa (Cahora Bassa) basins 313, 316, 316
wilderness areas of world importance 313, 316
profile above and below Victoria Falls 314, 315
rainfall determined by position of ITCZ 35
upper reaches
dambos 314, 328, 329–30
incised into Pre-Cambrian basement 313
pans to east and west of Barotse floodplain 314
terminates abruptly at Victoria Falls 314, 314
widens into Barotse floodplain 313, 313
