## Contents

Preface xi  
Foreword xii  

1 Chemical messengers and the cell membrane 1  
  1.1 Endocrine signalling by hormones 1  
  1.2 The nervous system and synaptic signalling by neurotransmitters 8  
      Small molecule neurotransmitters 11  
      Neuropeptides 13  
  1.3 Paracrine signalling by local chemical messengers 15  
  1.4 Hydrophobicity: effect on release and transport of messengers 16  
  1.5 Membrane proteins and membrane receptors 23  
  1.6 Ligand–receptor interactions 25  

2 Radioligand binding studies 29  
  2.1 Technical aspects of radioligand binding 29  
  2.2 Saturation binding 33  
  2.3 Competition binding 38  
  2.4 Kinetic experiments 46  
  2.5 Regional distribution of receptors 50  

3 Functional studies 53  
  3.1 Dose-response curves and associated problems 53  
  3.2 From receptor occupation to stimulus and response 56  
      From receptor occupation to stimulus 56  
      From stimulus to response: linear relationship 59  
      From stimulus to response: non-linear relationship 61  
  3.3 Receptor classification and antagonist affinity 65  
  3.4 Pharmacological models 69  

4 G protein-coupled receptors 77  
  4.1 From receptor to response: introduction to GPCRs 77  
  4.2 GPCR structure 86  
  4.3 Ligand interactions with family A, B and C receptors 97  
      Ligand interaction with family A receptors 98
Ligand interaction with family B receptors
Ligand interaction with family C receptors

4.4 Receptor activation
4.5 Activated GPCRs: interaction with G proteins
  Techniques to study G protein-coupling preference
  Divergence of intracellular signalling
4.6 Activated GPCRs: phosphorylation and internalization
  Receptor phosphorylation
  β-Arrestin binding mediated GPCR endocytosis
  Mechanisms to terminate signalling
4.7 β-Arrestin-binding and MAP kinase activation
4.8 GPCR dimerization and association with other proteins
  Introductory comments
  GPCR dimerization
  GPCR interaction with other membrane receptors
  GPCR interaction with other membrane proteins
  GPCR interactions with cytoplasmic proteins
4.9 Early models for GPCR activation
4.10 Restricted GPCR mobility and G protein coupling
  Membrane compartimentalization
  Restricted GPCR–G protein coupling: effector activity
4.11 Spontaneous receptor–G protein coupling
  Models
  Inverse agonism
4.12 Interaction of two G proteins with one activated receptor state
  Fusion proteins between GPCRs and G proteins
4.13 Multiple receptor conformations
  ‘Agonist trafficking’: what do models predict?
  Experimental ‘evidence’ for agonist trafficking: potential pitfalls
  Multistate receptors: ligand-mediated sequential changes in
  receptor conformation
  Multiple receptor states related to truncation, covalent modification
  and mutation
4.14 Multistate receptors and multiple ligand binding sites
  The general allosteric ternary complex model
  Exogenous and endogenous allosteric modulators
  allosteric phenomena at GPCR: detection by radioligand binding
  Detection of allosteric phenomena at GPCRs by functional assays
  Usefulness of allosteric modulators
4.15 ‘Competitive’, ‘non-competitive’ and ‘insurmountable’ antagonism
  Co-incubation, no receptor reserve
  Antagonist pre-incubation, no receptor reserve
4.16 Naturally occurring mutations of GPCRs

5 Concluding remarks
