INDEX

Acidithiobacillus, 132
Amazon Craton
  biostratigraphy of, 102–4, 103f, 105f
  cap carbonate in southern, 98
  contact between glacial deposits and cap carbonate in, 94, 97f
Cryogenian–Ediacaran boundary in southern, 89–108, 90f, 92f, 95f–97f, 98f, 100f, 103f, 105f, 106f
  geological-structural setting of southern, 95f
  geologic map of southwestern, 90f
  global correlations with, 104–7, 105f, 106f
  lithostratigraphy and major geologic events of, 92f
Marinoan cap carbonate in southern
  cap carbonate, 98–102, 98f, 100f
  cap dolostone, 99–101, 100f
  cap limestone cementstone, 101–2
  Marinoan glacial deposits, 93–94, 95f, 96f
  paleobiology of, 102–4, 103f, 105f
  paleogeographic map for, 74f
  representative fossils of, 103f
  simplified stratigraphic section of glacial deposits with, 96f
Ammonoids, 166
Angara Craton, 74f
Anomaly, 29
Anticosti Island, 147f
Argillaceous red, nodular, bioturbated wackestone, 166, 167f, 171f
Aspidella, 131f
Astartekloft, 192
Asteroid impact event, 224–25
Atar Group
  carbon isotope chemostratigraphy of, 80f
  paleogeographic map for, 74f
Atmospheric oxygenation
  Archean-Proterozoic boundary with, 35–43, 42f
  geochemical proxies for, 41–42, 42f
  geological evidence of, 36f
Australia, 56
  carbon isotope data for carbonate sequences of, 58f
  chronostratigraphic framework of, 51f
  plot of $\varepsilon_{180}$ versus age of concordant detrital zircons, 64f
  stratigraphic sections for, 58f
Avalon Assemblage, 127
Avalonia, 74f
BACE. See Basal Cambrian Excursion
Background value, 29
Baltica (Russian craton), 74f
Baltica Paleoplate, 53–54
  chronostratigraphic framework of, 51f
Banded iron formation (BIF)
  Archean-Proterozoic boundary with, 42f
  chemostratigraphic curves with, 42f
  of Dales Gorge Member of Brockman Iron Formation, 43
  evidence of oxygenation in Archean-Proterozoic boundary from, 35, 36f
  isotopic fractionation with, 10–11
  $\delta^{53}Cr$ values for, 39–40
  Basal Cambrian Excursion (BACE), 122–23
  Bastar Craton, 54–55, 54f
  Beggiatoa, 132
  BIF. See Banded iron formation
  Birkhill Shale, 147–48
  Bocaina Formation, insertion of post-Marinoan carbonates of, 106f
  Bootstrap sample test, 173, 173f
  Boron isotopes, 9–10
  Brasilia Deform Belt, marine sedimentary record studied in, 76
  Bristol Channel Basin at St. Audries Bay, 189
  Brockman Iron Formation, 43
  Bylot Supergroup
    carbon isotope chemostratigraphy of, 80f, 81f
    chemostratigraphic pathways of, 79
    iron speciation data from, 83
    lithostratigraphy of, 81f
    paleogeographic map for, 74f
Calcario Tangará quarry, 98f
Calcium isotopes, 9–10
Calymmian period, 48, 51f, 52–53, 59, 64
depositional age for Dongchuan Group, 56
deposition of large red beds during, 61
sedimentary rocks of, 63
Calymmian rift, 47
Cambrian explosion, 123–24
CAMP. See Central Atlantic magmatic province
Canada
Ordovician paleogeographic position in, 147f
Truro Island, Arctic in, 147f, 150–51, 152f
Carbonate–associated sulfate (CAS)
analyses in transitional Ediacaran to Cambrian
successions, 123
composition of, 60
isotopic compositions of, 121–22
measurements of sulfur isotopes on, 8
Carbonate microfacies
argillaceous red, nodular, bioturbated wackestone, 166,
167f, 171f
gray/yellow nodular sponge wackestone, 166, 168f, 171f
laminated bindstone, 166, 169f, 171f, 172f
oncoid wackestone/floatstone, 166, 168, 170f, 172f
Carbon isotopes, 5–6. See also Jurassic-Cretaceous carbon
isotope geochemistry
analysis and sampling strategies with, 165–66
Araras Group in chemostratigraphy with, 105f
carbonate sequences data for, 58f, 59, 59f, 60
chemostratigraphy, 75f, 76f, 79f, 80f, 81f, 105f, 193,
194f–95f
composition analysis results with, 172–74, 173f, 173t
compositions in Mesoproterozoic–Neoproterozoic transition
of, 81, 82f
curves coupled with $^{60}Cr$, 10, 12
Ediacaran-Cambrian transition, trends leading up to, 122
Permian-Triassic boundary with composition of,
160–62, 161f
sampling strategies with, 162–64, 163f
signature of carbonate sections in NCC, 60
stratigraphy for Triassic-Jurassic chemostratigraphy, 193,
194f–95f
terminal Ediacaran stage trend in composition of, 119f
Turukhansk Group with chemostratigraphy of, 75f
within-bed variability for, 174–75
Carbon isotope stratigraphy
Jurassic-Cretaceous boundary, 216–18, 217f
Jurassic-Cretaceous carbon isotope geochemistry with,
214–15
as paleoceanography tool, 216
Paleocene-Eocene Thermal Maximum with, 14
terminology, 215–16
Triassic-Jurassic chemostratigraphy with, 193, 194f–95f
CAS. See Carbonate–associated sulfate
Cenozoic era
chemostratigraphy, 261–72, 268f
chemostratigraphic markers in, 269–71, 270f
introduction to, 261–62
chronostratigraphy of, 262–63
geological events impacting spatial and temporal scales in
biotic events, 264–66
climatic events, 266–67
relative sea-level trends, 267–68, 267f
tectonic events, 263–64
hydrophere-atmosphere-biosphere changes in, 261
isotopes of, 270f
Mesozoic era trends continued in, 271–72
temperature of, 270f
Central Atlantic magmatic province (CAMP)
basalt emplacement, 197f
basalt flows, 196, 198
carbon cycle change with emplacement of, 201
composition of, 187
Eiberg Basin associated with, 189
end-Triassic mass extinction correlation with
eplacement of, 196
environmental changes triggered by, 185
evolution of, 185
global change events from emplacement of, 200
magmatic records of Morocco and North America, 189
palaeogeographic map associated with, 186f
rocks of, 186f
siliciclastic stratigraphic unit from, 188
start of activity from, 188
volcanism, 185, 187–89, 201
weathering, 200
Changcheng system, 50, 50f, 51f, 52, 55, 59–61
Charniodiscus spinosus, 131f
Chemical stratigraphy, 28
Chemochron, 29
Chemostratigraphic index, 29
Chemostratigraphy
Cenozoic, 261–72, 268f, 270f
chronostratigraphic boundaries, 14
$^{60}Cr$, 145–56, 146f–49f, 151f–53f, 155f
defined, 29
detrital zircon record in, 48, 61–64, 62f, 64f
development of, 4–14
Ediacaran-Cambrian transition in, 117–24, 119f, 120f
elemental, 3, 12–14
as formal stratigraphic method, 14–15
glossary of, 27–30, 28f
interdisciplinary nature of, 27
isotope stratigraphic markers in, 163–64, 163f
isotope systems (See Isotope systems)
Paleoproterozoic-Mesoproterozoic transition, 47–65,
49f–51f, 54f, 58f–60f, 62f, 64f
across Permian-Triassic boundary, 159–77, 161f, 163f,
167f–73f, 173t
popularity of, 27
Precambrian, 3, 5
publications, 27–28, 28f
sampling strategies with, 162–64, 163f
Triassic-Jurassic boundary, 193–200, 194f–95f, 199f
Chemozone, 29
Chhattisgarh basin, geological map showing, 54f
China
Jixian System, 55
Meishan in south, 161f
North China Craton, 48, 50, 51f, 52, 55, 59f, 61, 64f
South China Craton, 56
Wangjiwan, Yangtze platform, 147f, 150, 151f

Chromium isotopes, 10–11
Evidence of oxygenation in Archean-Proterozoic boundary from, 39–40, 39f
evolution of seawater in Precambrian era, 39f
mass-independent fractionation, 11
Neoproterozoic carbonates with, 40
oxidation states of, 39
ratios, 39
terminal Ediacaran stage with, 123

Chupinguaia region, 98f

Climate
Carbon isotope geochemistry as paleoclimatic tool, 212–13
Cenozoic era, 266–67
Ediacaran-Cambrian transition with, 124–27, 125f
