INDEX

Note: Page numbers in *italics* indicate figures; tables are denoted with ‘t’.

- abiotic challenges
  - costs of adaptation, 297–298
  - trade-offs, 297–298
- adaptation costs, abiotic challenges, 297–298
- adaptive animal personality, 56
- adaptive explanations, personality-related differences in plasticity, 61–63, 62
- adaptive value of seasonality, 247–250
- adaptive values of endogenous circadian clocks, 240–244
- additive effects, population genetics, 93
- aging. See senescence
- allocation (or compensation) model, energy metabolism, 223
- allostasis, 120–121, 121, 122–123
- allostasis model, stress responses, 188–189
- *Anolis sagrei* (brown anole), integrating costs of reproduction, 161–163, 162
- Antagonistic Pleiotropy theory, senescence, 258
- anuran development
  - phenotypic plasticity, 82–83
  - polyphenic morphs, 82–83
  - resource polymorphism, 83
  - aphids, dispersal polyphenism, 78–79
- *Arabidopsis thaliana*, epigenetics, 114–115, 114
- atavisms, Selection-Pleiotropy-Compensation (SPC) model, 99–100
- bacteria, trade-offs: viral defense vs competitive ability, 296–297, 296
- basis functions, curve-thinking, 42
- behavioral plasticity
  - individual differences, 58–59
  - personality-related differences, 58–61
  - behavioral reaction norm (BRN) approach personality and plasticity, 56–58
- phenotypic plasticity, 56–58, 59
- random regression, 57
- best-linear unbiased predictors (BLUPs), individual by environment interaction (I × E), 29–32
- *Bicyclus* butterflies, wing polyphenism, 80–82
- biological rhythms. See also circadian rhythms; circannual cycles and seasonality; timekeeping properties, 238
- BLUPs. See best-linear unbiased predictors
- body size. See also growth and size regulation
- environmental gradients, 294–295
- resource availability, 294–295
- trade-offs, 294–295
- BRN. See behavioral reaction norm approach
- brown anole (*Anolis sagrei*), integrating costs of reproduction, 161–163, 162
- catecholamines, stress responses, 189–190
- change and stasis. See stasis and change
- circadian rhythms, 238–244. See also circannual cycles and seasonality; timekeeping
- adaptive values, endogenous circadian clocks, 240–244
- extrinsic adaptive value, 242–244
- individual variation, 244
- intrinsic adaptive value, 241–242
- molecular genetic mechanisms, 238–240, 239
- neural and endocrine organization, 240, 241–242
- physiological mechanisms, 240, 241–242
- population variation, 244
- suprachiasmatic nuclei (SCN), 240, 241–242, 243
circannual cycles and seasonality, 244–250. See also circadian rhythms; timekeeping
adaptive value of seasonality, 247–250

simple vs complex, 125–126
stasis and change (cont’d)
statistical epistasis, 94–95
time scales, 126, 128–129, 129
statistical epistasis, 94–95
stress responses, 187–200
adaptive significance of the phenotypic modification, 194–195, 195
allostasis model, 188–189
catecholamines, 189–190
connections, physiological mediators, 199–200
definitions, 187–188
developmental plasticity, 191–196, 192, 193
epigenetic modifications by stressors, 198–199
glucocorticoids (GCs), 188–193, 196–200
hormonal responses, 189–191
maternal matching hypothesis, 194–195
organismal responses to stressors, 189–191
parental care, 191–196, 195, 197
phenotypic plasticity, 191–196
reactive scope model, 189
regulators, 190–191
variation, individual, 196–198
suprachiasmatic nuclei (SCN), circadian rhythms, 240, 241–242, 243
telomer, senescence, 262–263
temperature effects. See also thermal performance curves (TPCs)
geographic ranges, 279–281, 280, 283–286, 285
individual by environment interaction (I × E), 30–32
phenotypic plasticity, 30–32
template mode of variation (TMV), principal components analysis (PCA), 48
thermal performance curves (TPCs). See also temperature effects
curve-thinking, 42–50, 43, 44
Impatiens capensis (Jewelweed) plants, 46–50, 48, 49
Pieris rapae (Imported Cabbageworm) larvae, 46–47, 47, 49, 50
thyroid hormones, senescence, 264
timekeeping, 235–250
biological rhythms, 238
circadian rhythms, 238–244
circannual cycles and seasonality, 244–250
endogenous vs environmental drivers, 235–238, 237
entrainment variation, 236–238, 237
TMV. See template mode of variation
TPCs. See thermal performance curves
trade-offs, 291–303
abiotic challenges, 297–298
bacteria, 296–297, 296
biological diversity, 291–303
body size, 294–295
competitive ability vs viral defense, 296–297, 296
conflicting evidence, 299–300
core theme characterizing integrative organismal biology, 310
distributions of species, 298–299
Dobzhansky-Muller incompatibilities, 303
early growth-final size tradeoff, 44, 45, 52
ecological defense, 295–297
energy metabolism, 223, 225, 227, 228
environmental gradients, 294–295
evolutionary forces, 300
evolutionary trade-offs, 298–299
fitness, 292–294, 292
Gerbillus spp., 295
immune systems, 169–170, 172–173, 177
natural enemies, 295–297
niches, 293
phenotypic plasticity, 194, 294
physiological regulatory networks (PRNs), 143, 146–147
plant adaptation to serpentine soils, 297–298, 298
predation, 295–297
resource availability, 294–295
senescence, 259
specialization, 294
species formation, 303
universality? 299–300
variation, 299–300
viral defense vs competitive ability, 296–297, 296
warblers (Parulidae), 300–302
trait integration
complexity, 10–11
function-valued traits (FVTs), 39–40
traits/environment interactions, complexity, 311–312
transcription factors, pleiotropy, 101–102
ultimate theories of aging, senescence, 258–259
unification need, organismal biology, 3–4
variational modularity
genetic effects, 95
Wagner-Altenberg model, 100–101, 101
vertical shift hypothesis, 42–45, 43, 44, 48, 49, 50

Wagner-Altenberg model
Selection-Pleiotropy-Compensation (SPC) model, 100–101, 101
variational modularity, 100–101, 101

warblers (Parulidae), trade-offs, 300–302
wild animals, senescence, 265–266, 267
wing polyphenism, Bicyclus butterflies, 80–82
Y-model, energy metabolism, 223–225, 224
