1  **Introduction**  1  
1.1  Present Status of Grid Operation  1  
1.1.1  General  1  
1.1.2  HVDC Transmission  4  
1.1.3  Reliability of Electricity Supply  4  
1.2  Overview of System Dynamics and Control  4  
1.2.1  Power System Stability  4  
1.2.2  Mathematical Preliminaries  6  
1.2.3  Stability of Equilibrium Point  6  
1.2.4  Steady-State Behavior  8  
1.3  Monitoring and Enhancing System Security  10  
1.4  Emergency Control and System Protection  11  
1.5  Recent Developments  12  
1.5.1  Power System Protection  12  
1.5.2  Development of Smart Grids  13  
1.5.3  Microgrids  14  
1.5.4  Role of System Dynamics and Control  14  
1.6  Outline of Chapters  14

2  **Grid Characteristics and Operation**  19  
2.1  Description of Electric Grids  19  
2.2  Detailed Modeling of Three-Phase AC Lines  21  
2.3  Circuit Models of Symmetric Networks  22  
2.4  Network Equations in $DQo$ and $\alpha\betao$ Components  23  
2.4.1  Transformation to Park ($dqo$) Components  24  
2.4.2  Steady-State Equations  25  
2.4.3  $D-Q$ Transformation using $\alpha-\beta$ Variables  26  
2.5  Frequency and Power Control  28  
2.5.1  Tie-Line Bias Frequency Control  31  
2.6  Dynamic Characteristics of AC Grids  33
2.6.1 Grid Response to Frequency Modulation 33
2.6.2 Grid Response to Injection of Reactive Current 35
2.7 Control of Power Flow in AC Grids 38
2.7.1 Power Transfer Capability of a Line 38
2.7.2 Power Flow in a Line connected to an AC Transmission Grid 41
2.8 Analysis of Electromagnetic Transients 42
2.8.1 Modeling of Lumped Parameter Components 42
2.8.2 Modeling of a Single-Phase Line 43
2.8.3 Approximation of Series Resistance of Line 44
2.8.4 Modeling of Lossless Multiphase Line 45
2.8.5 Modeling of Multiphase Networks with Lumped Parameters 46
2.9 Transmission Expansion Planning 47
2.10 Reliability in Distribution Systems 48
2.11 Reliable Power Flows in a Transmission Network 48
2.12 Reliability Analysis of Transmission Networks 50
2.A Analysis of a Distributed Parameter Single-Phase Line in Steady State 51
2.A.1 Expressions for a Lossless Line 53
2.A.2 Performance of a Symmetrical Line 54
2.B Computation of Electrical Torque 55
References 57

3 Modeling and Simulation of Synchronous Generator Dynamics 59
3.1 Introduction 59
3.2 Detailed Model of a Synchronous Machine 59
3.2.1 Flux Linkage Equations 60
3.2.2 Voltage equations 61
3.3 Park's Transformation 62
3.4 Per-Unit Quantities 69
3.5 Equivalent Circuits of a Synchronous Machine 72
3.6 Synchronous Machine Models for Stability Analysis 76
3.6.1 Application of Model (2.1) 80
3.6.2 Application of Model (1.1) 80
3.6.3 Modeling of Saturation 82
3.7 An Exact Circuit Model of a Synchronous Machine for Electromagnetic Transient Analysis 82
3.7.1 Derivation of the Circuit Model 83
3.7.2 Transformation of the Circuit Model 87
3.7.3 Modeling of a Synchronous Generator in the Simulation of Electromagnetic Transients 91
3.7.4 Treatment of Dynamic Saliency 92
3.8 Excitation and Prime Mover Controllers 93
3.8.1 Excitation Systems 93
3.8.2 Modeling of Prime-Mover Control Systems 98
3.9 Transient Instability due to Loss of Synchronism 101
3.10 Extended Equal Area Criterion 103
3.11 Dynamics of a Synchronous Generator 104
Network Equations 104
Calculation of Initial Conditions 106
System Simulation 108
3.A Derivation of Electrical Torque 110

4 Modeling and Simulation of Wind Power Generators 115
4.1 Introduction 115
4.2 Power Extraction by Wind Turbines 116
4.2.1 Wind Speed Characteristics 117
4.2.2 Control of Power Extraction 118
4.3 Generator and Power Electronic Configurations 120
4.3.1 Wind Farm Configurations 122
4.4 Modeling of the Rotating System 122
4.5 Induction Generator Model 124
4.5.1 Rotor Speed Instability 127
4.5.2 Modeling Issues 130
4.5.3 Frequency Conversion Using Voltage Source Converters 132
4.6 Control of Type III WTG System 133
4.6.1 Rotor-Side Converter Control 133
4.6.2 Grid-Side Converter Control 136
4.6.3 Overall Control Scheme for a Type III WTG system 137
4.6.4 Simplified Modeling of the Controllers for Slow Transient Studies 141
4.7 Control of Type IV WTG System 142

5 Modeling and Analysis of FACTS and HVDC Controllers 145
5.1 Introduction 145
5.2 FACTS Controllers 146
5.2.1 Description 146
5.2.2 A General Equivalent Circuit for FACTS Controllers 147
5.2.3 Benefits of the Application of FACTS Controllers 148
5.2.4 Application of FACTS Controllers in Distribution Systems 150
5.3 Reactive Power Control 150
5.3.1 Control Characteristics 153
5.4 Thyristor-Controlled Series Capacitor 153
5.4.1 Basic Concepts of Controlled Series Compensation 155
5.4.2 Operation of a TCSC 157
5.4.3 Analysis of a TCSC 158
5.4.4 Computation of the TCSC Reactance ($X_{TCSC}$) 159
5.4.5 Control of the TCSC 161
5.5 Static Synchronous Compensator 166
5.5.1 General 166
5.5.2 Two-Level (Graetz Bridge) Voltage Source Converter 168
5.5.3 Pulse Width Modulation 169
5.5.4 Analysis of a Voltage Source Converter 171
5.5.5 Control of VSC 175
5.6 HVDC Power Transmission 177
5.6.1 Application of DC Transmission 178
5.6.2 Description of HVDC Transmission Systems 178
5.6.3 Analysis of a Line Commutated Converter 180
5.6.4 Introduction of VSC-HVDC Transmission 186
5.6 A Case Study of a VSC-HVDC Link 190

6 Damping of Power Swings 195
6.1 Introduction 195
6.2 Origin of Power Swings 196
6.3 SMIB Model with Field Flux Dynamics and AVR 199
6.3.1 Small-Signal Model and Eigenvalue Analysis 201
6.4 Damping and Synchronizing Torque Analysis 205
6.5 Analysis of Multi-Machine Systems 210
6.5.1 Electro-Mechanical Modes in a Multi-Machine System 210
6.5.2 Analysis with Detailed Models 216
6.6 Principles of Damping Controller Design 225
6.6.1 Actuator Location and Choice of Feedback Signals 229
6.6.2 Components of a PSDC 230
6.6.3 PSDCs based on Generator Excitation Systems: Power System Stabilizers 231
6.6.4 Adverse Torsional Interactions with the Speed/Slip Signal 237
6.6.5 Damping of Swings using Grid-Connected Power Electronic Systems 237
6.7 Concluding Remarks 241
6.8 Eigenvalues of the Stiffness matrix K of Section 6.5.1 242
6.9 Three-Machine Data 244

7 Analysis and Control of Loss of Synchronism 247
7.1 Introduction 247
7.2 Effect of LoS 247
7.3 Understanding the LoS Phenomenon 249
7.4 Criteria for Assessment of Stability 251
7.5 Power System Modeling and Simulation for Analysis of LoS 252
7.5.1 Effect of System Model 254
7.5.2 Effect of Changing Operating Conditions 255
7.6 Loss of Synchronism in Multi-Machine Systems 256
7.6.1 Effect of Disturbance Location on Mode of Separation: 258
7.6.2 Effect of the Load Model 258
7.6.3 Effect of Series Compensation in a Critical Line 260
7.6.4 Effect of a Change in the Pre-fault Generation Schedule 261
7.6.5 Voltage Phase Angular Differences across Critical Lines/Apparent Impedance seen by Relays 261
7.7 Measures to Avoid LoS 263
7.7.1 System Planning and Design 263
7.7.2 Preventive Control During Actual Operation 264
7.7.3 Emergency Control 264
7.8  Assessment and Control of LoS Using Energy Functions  265
7.8.1  Energy Function Method Applied to an SMIB System  266
7.8.3  Evaluation of Critical Energy in a Multi-Machine System  274
7.9  Generation Rescheduling Using Energy Margin Sensitivities  274
7.9.1  Case Study: Generation Rescheduling  276
7.9.1  Case Study: Generation Rescheduling  276
7.A  Simulation Methods for Transient Stability Studies  276
7.A.1  Simultaneous Implicit Method  277
7.A.2  Partitioned Explicit Method  277
7.B  Ten-Machine System Data  279
