INDEX

acetylene black, 433
2-acrylamido-2-methylpropanesulfonic acid (AMPS), 393
acrylonitrile–butadiene–styrene (ABS), 251
active interfaces, 139
N-acyllactam activated anionic polymerization of \( \varepsilon \)-caprolactam (AAPCL)
complex viscosity, 556–560
crystallization, 558
isothermal kinetics, 556
MWCNT-CL-Na ionic complex, 561, 563
PA6, measured vs. simulated molar masses, 560–562
pristine MWCNT, 560, 561
viscosity behavior, change in, 558
AFM see atomic force microscopy (AFM)
aggregating nucleation and growth (ANG), 280
aging, 90–92, 214
alkylammonium cations, 31–33, 38
\( \text{Al}_2\text{O}_3 \) nanoparticles, 12
alumina silicate clay, 7
ANG see aggregating nucleation and growth (ANG)
Astarita’s parameter, 156
atomic force microscopy (AFM), 59, 137, 159, 244, 455
2,2’-azobisisobutyronitrile (AIBN), 243, 244
Bacillus cereus, 350
bacterial cellulose (BC), 456, 460–462
binodal temperature, 507
boehmite alumina (BA), 366
Boltzmann constant, 440, 507
Bousmina model, 497
Brabender mixer, 47
buckyballs, 405
caging effect, 214
Capillary Breakup Extensional Rheometer (CaBER), 100
carbon black (CB) composites, 11
colloid theory, 434
DC conductivity, 437–440
dispersion, 435
DSC, 436
EBA copolymer
AC conductivity, 443–444
anomalous frequency dispersion, 441
applications, 435
complex permittivity vs. frequency, 440–442
carbon black (CB) composites (Continued)
crossover frequency, 441, 443
glass transition temperature, 435
log–log plot, 441, 443
melting temperature, 435
sample preparation, 435
universal response of Jonscher, 441
electrical and dielectric measurements, 436
epoxy polymer composites, dielectric studies, 434
ethylene–octane copolymer, 433
furnace process, 433
high surface area, 433
lock-in amplifier method, 436–437
PE/PS blends, 515–516
percolation model theory, 433–434
percolation threshold, 433, 434
permittivity behavior, 434
PMMA/PP blends, 517
polypropylene, 433
polystyrene, 435
production, problem in, 432
PTCR effect
DC resistivity vs. temperature, 445, 446
DSC thermograms, 444–445
glass transition temperature, tangents, 445, 446
resistivity vs. temperature, 446–447
tunneling, 445–446
as reinforcing filler, 432
structure, 432
two-phase polymer blend, 433
types of, 433
universal dielectric response, 434
carbon nanotubes (CNTs), 6, 29, 138, 405–406
electrically conducting nanoparticles, 432
“grafting to” technique, 548
vs. graphite, 237
in situ polymerization
AAPCL, MWCNTs (see multi-walled carbon nanotubes (MWCNTs))
Couette-type rheoreactor, 554–556
“grafting from” technique, 548
melt blending, 548
MWCNTs, 237
nanofiller-reinforced polymer matrix, 235
percolation threshold (see percolation threshold)
polymer coating, 548
processing techniques
dry powder, wet and partial solution mixing, 241–242
homogeneous dispersion, 237
in situ polymerization (see in situ polymerization)
melt blending (see melt blending)
polymer matrix, 238
solution processing, 238–241
van der Waals forces, 238
rheological properties of
dilute regime, 254–255
intertube van der Waals (VDW) attraction, 254
semidilute regime (see semidilute regime)
solution blending, 548
SWCNTs, 236
carboxymethyl chitosan (CMCTS), 350
Carreau-type equation, 155
Casson plot, 376
cation-exchange capacity (CEC), 32, 190

cellulose
all-cellulose composites, 454
biomass resources, 455
chemical structure, 455
nanocellulose (see nanocellulose)
polymer matrix interface, 454
properties, 454
as reinforcement, 454
cellulose nanocrystals (CNCs), 341, 457–459, 464–465
cellulose nanofibrils (CNFs), 341, 456, 457, 459, 466–470
cetyltrimethylammonium bromide (CTAB), 385
chain-growth polymerization, 15
channel black, 433
chemically modified graphene (CMG), 151
chemical vapor deposition (CVD), 10, 251, 253
chitin, 453, 482
chemical structure, 459, 472
nanochitin
applications, 481
aqueous counter-collision method, 455
nanowhiskers, 459, 472, 476
natural sources, 455
phthaloylation, 472
structure–property correlations, 454
whiskers, 455, 472–476
chitosan, 408
clay
alumina silicate, 7
MMT, 7
montmorillonite clay, 405
Smectite, 32
synthetic clay, 405
cluster-cluster aggregation (CCA) model, 80
CNCs see cellulose nanocrystals (CNCs)
CNTs see carbon nanotubes (CNTs)
coagulation technique, 240
coupled with viscoelastic phase separation (C-VPS), 280
coarse-grained polymer model, 104
Cogswell approach, 157
concentration fluctuation, 507–509
Cox–Merz rule, 94, 265
CTAB see cetyltrimethylammonium bromide (CTAB)
Custom Scientific Instruments, 52
Debye–Bueche equation, 217
deKee–Turcotte model, 106
density functional theory (DFT), 126
dibenzylidene sorbitol (DBS), 531, 532
differential scanning calorimetry (DSC) carbon black composites, 436, 444–445 PP/GNs nanocomposites, 416–418 \(N,N\)-dimethylformamide (DMF), 40, 411, 412
dodecyl sulfate (DDS), 8
double reptation model, 493
double-walled carbon nanotubes (DWCNTs), 33, 247
DSC see differential scanning calorimetry (DSC)
dynamic heterogeneity, 493, 494
dynamic rheology
BSW model, 107
deKee–Turcotte model, 106
elastic dumbbell model, 108
filler-polymer interactions, 109
hard spherical inclusions, 105
Herschel–Bulkley model, 106
internal chain-scale structure, 108
modified Cole model, 107
non-Newtonian models, 106
self-similar relaxation pattern, 107
Einstein’s equation, 367
electrical percolation thresholds
MWCNT/polystyrene composite, 572, 573
vs. rheological percolation threshold, 574–577
electronic energy band theory, 35
electrospinning
electrospun nanofibers, 333
fiber formation, 333
nanofiber morphology, 332
process parameters operating conditions, 335–336
process conditions, 336–337
solution properties, 333–335
rheology
antibacterial assays, 350
carbon black nanoparticles, 342
carbon nanocapsule, 349
cellulose nanofibers, 341
chitosan and alginate-based nanofibers, 337
clay/nanofiber hybrid sheets, 350
CNFs, 348
CNT-anchored polymer nanofiber mats, 348
cyclodextrins, 346
defect-free fiber formations, 341
dimethyl acetamide, 347
electrical conductivity and surface tension, 338
FESEM images, 345
gelatin, 343
Newtonian behavior, 340
oxidative polymerization methods, 348
PEDOT nanofiber, 343
PEEK/MWNT composites, 349
PEO, 351
PFSA/PVP ratios, 342
polyimide morphology, 347
PTACM resin, 346
PVA solutions, 340
spider-net-like structures, 345
taylor cone, 331
elongational flow mixer (RMX®)
assembly and operating principles, 152–155
capillary rheometer geometry, 156–158
dispersive mixing, 136
distributive mixing, 136
flow analysis, numeric simulation, 155–156
high shear rates, 135
morphology, 136
multipass rheometer, 151
polymer blends
capillary number, Ca, 138–142
compatibilization, 137
compatibilizer filler/polymer effect, 170–172
defformation-breakup process, 162
EPDM, 161
EVA, 138
FCM, 145
“folding” process, 142
immiscibility, 137
interfacial instability, 163
intermeshing-type devices, 144
liquid-liquid (viscoelastic) systems, 136
melt processing of, 138
mixing/processing equipment, 142
Palierne model, 145, 146
performance comparison, 168–170
“pushing/squeezed” mechanism, 161
Rayleigh’s instabilities, 162
rheology/morphology relationships, 172–173
SSE, 143
elongational flow mixer (RMX®) (Continued)
steady-state morphology, 162
transitional phenomenon, 160
TSE, 143, 144
van der Waals forces/interfacial tension, 143
viscosity ratio, 165–168
viscous heating, 170
polymer nanocomposites
chemical/solvent approaches, 147
complex viscosity, 177
different dispersion patterns, 180
elastic modulus, 178
filler networking, 175
graphene-based fillers, 173
graphite/polymer nanocomposites, 176
manufacturing methods, 175
microdispersibility, 175
montmorillonites, 147
optical microscopy images, 174
PLA, 177
PLA/EG nanocomposites, 181
polymer-polymer multiphase systems, 173
pressure trajectory, 178
reinforcement mechanisms, 179
solid additives, dispersion of (see solid additives, dispersion of)
TEM characterization, 180
XRD diffractograms, 181
theoretical advantages, 136
elongational rheology
Cauchy strain tensors, 110
conformation tensor level, 113
Finger strain tensor, 110
flow-induced stress, 111
Giesekus model, 111
K-BKZ constitutive equation, 109
mesoscopic rheological model, 112
modified FENE-P model, 113
PSM–LT model, 110
WD–FO model, 110
"emulsion" processing method, 120
EPDM see ethylene–propylene–diene terpolymer (EPDM)
Escherichia coli, 350
ethylene acrylic ester copolymers, 435
ethylene butyl acrylate (EBA) copolymer applications, 435
carbon black composites
AC conductivity, 443–444
anomalous frequency dispersion, 441
complex permittivity vs. frequency, 440–442
crossover frequency, 441, 443
log–log plot, 441, 443
sample preparation, 435
universal response of Jonscher, 441
glass transition temperature, 435
melting temperature, 435
ethylene methyl acrylate (EMA) copolymer, 435
ethylene–methyl acrylate–glycidyl methacrylate (E–MA–GMA) terpolymer, 48
ethylene–octene copolymer (EOC), 369
ethylene–propylene–diene terpolymer (EPDM), 161, 372
ethylene-vinyl acetate (EVA), 101, 138, 509, 510
2-ethyl hexyl acrylate (2HEA), 435
exfoliated graphene oxide, 410
expanded graphite (EG), 10, 151
Farrel Continuous Mixer (FCM), 145
fast Fourier transform (FFT), 201
filament-stretching experiments (FiSER), 100
filler networking mechanism, 358, 369
Flory Huggins theory, 286
flow properties, nanocomposites
elongational flow CaBER, 100
EVA, 101
filament stretching, 99
Hencky strains, 100
homogeneous stretching, 99
"house-of-cards" network structure, 102
LDPE composite systems, 101
Meissner's rheometer, 100
polypropylene/layered silicate nanocomposites, 103
rotary clamp technique, 100
rubber processing operations, 99
strain-hardening effect, 102
"stretching" techniques, 100
tactoids, 102
flow-induced structure, 97–99
nonlinear behavior, 92
steady-state flow curves
anisotropic particles, 97
Cox–Merz relation, 94
equilibrium shear modulus, 95
"filler network," 96
Herschel-Bulkley's equation, 95
hydrodynamic models, 93
Krieger's semi-empirical equation, 94
nanoparticle-polymer interaction, 96
Newtonian behavior, 94
shear-thinning behavior, 93
foam injection molding (FIM) process, 227
Fourier transform infrared (FTIR) technique degradation residues, 313
PVDF/GOs nanocomposites, 413–414
free radical graft polymerization (FRGP), 243
fullerenes, 10
functionalized carbon nanotube (FCNT), 250
functionalized graphene sheets (FGS), 151
furnace black, 433

Generalized Rouse Model, 105
generic rheology, polymer nanocomposites
alternative energetic (enthalpic) model, 70
CNTs, 71
flowproperties (see flowproperties, nanocomposites)
fumed silica, 69, 70
molten nanofilled polymers, 71
nanocomposites process
blending procedure, 119–121
new processing routes, 124
usual processing methods, 121–123
nanocomposites rheology
constitutive equations, 103
dynamic rheology (see dynamic rheology)
elongational rheology (see elongational rheology)
Payne effect (see Payne effect)
steady-state viscosity, 104–105
network elasticity, 70
organoclay-based nanocomposites, 70
Payne effect, 69
platelet nanocomposites, 71
thixotropic phenomenon, 69
viscoelasticity (see viscoelasticity, nanocomposites)
Girifalco–Good equation, 511, 512
Gluconacetobacter xylinus, 456
“grafting from” approach, 39
graphene
building blocks, 406, 407
carbon atoms, 407
chemical reduction, 406
cost-effective production, 406
dimensionality, 407, 408
electrical conductivity, 407, 408
gas permeability, 407, 408
graphite oxide (see graphene oxide nanosheets (GOn))
high specific surface, 407
incorporation into polymer matrix, 406–407
melt mixing, 407, 409, 410
PA6/ABS, electrical properties, 423–425

as reinforcement, advantages, 410
SEM and TEM, 409
in situ polymerization, 407, 408
solution blending techniques, 408–409, 411–412
solvent mixing, 407
tensile strength, 407, 408
thermal conductivity, 407, 408
thermal reduction, 406, 409, 410
twin-screw microextruder, 407, 409–411
viscoelastic behavior, 406, 410, 421
X-ray diffraction, 410
Young’s modulus, 407, 408
graphene oxide nanosheets (GOn)
cost-effective production, 406
exfoliation/chemical reduction, 410
HDPE
tensile strength, 419, 420
thermal decomposition, 415–416
Young’s modulus, 418–420
in situ chemical reduction, 408
polypropylene
complex viscosity, 422, 423
crystallization and melting properties, 416–418
tensile strength, 419, 420
thermal degradation, 416
Young’s modulus, 418–420
dependent viscosity, 408
PVA and chitosan, 408
PVDF
crystalline structure, 412
FTIR analysis, 413–414
piezoelectric and pyroelectric behavior, 412
tensile strength, 419, 420
thermal stability, 415–416
XRD patterns, 412–413
Young’s modulus, 418–420
graphite intercalation compound (GIC), 10, 151
graphite nanoplatelets (GNPs), 10, 151
graphite oxide (GO), 151
Guth–Smallwood equation, 80
Halloysite nanotubes (HNTs), 7
Halpin–Tsai model, 261
HDPE see high-density polyethylene (HDPE)
head-to-head polypropylene (hhPP) blend, 494
Herschel–Bulkley’s equation, 95, 96, 106
heteropolyacids (HPAs), 349
“hierarchical filler structures,” 265
high-density polyethylene (HDPE), 41, 122, 162
tensile strength, 419, 420
thermal decomposition, 415–416
Young’s modulus, 418–420
immiscible polymer blends
co-continuous morphology
  image analysis, 498
  PEO/PVED-HFP blend, 499
  PMMA/SMA blend, 499
  POE/PS blend, storage modulus of, 497, 498
  selective extraction, 498
  Veenstra model, 497
droplet-matrix morphology
  Bousmina model, 497
  collide and coalescence, 501
  critical droplet size vs. shear rate, 502, 503
direct-fitting method, 497
  Maxwell-type expression, 496
  Palierne model, 497
  PDMS/PIB blend, 496–497
  PP/POE blend, 496, 497
  relaxation spectrum method, 497
  shear flow, 499–500
  thread break process, 500
transient behaviors, 501–502
nanoparticles, selective localization
  compatibilization mechanism, 522–523
  contact angle measurement, 512
  Girifalco—Good equation, 511, 512
  HDPE/PEO blend, 520
  low and high aspect ratio, 518, 519
  Owens—Wendt equation, 511, 512
  PA6/ABS/nanosilica system, 520, 522
  PC/SAN/CNT system, 516
  PC/SAN/graphene system, 516
  PC/SAN/MWCNT system, migration mechanism, 518
  PE/PA/clay ternary composites, 517
  PET/P/P/TiO$_2$, 514
  PLA/PCL/MWCNT, 517
  PMMA/PP/CB ternary nanocomposites, 517
  polymer–nanoparticle interaction, 510–511
  polymer–polymer interaction, 510, 511
  PP/EOC blends, 520, 522
  PP/EVA/silica blends, 509, 510
  PP/PS/CB blends, 515–516
  PP/PS/MWCNT, 519–521
  PS/PLA/silica ternary nanocomposites, 522
  SAN/PPE/MWCNT, 512–514
  wetting coefficient, 511–513
  Young’s equation, 512
impedance spectroscopy, 436
inorganic nanomaterials
  amorphous polymers, 356
  dispersed nanoparticles and polymer chains, 357
  dispersion quality, 358
molecular structure and polymers dynamics, 359
multifunctional materials, 357
polymer metal oxide nanocomposites
  alumina nanoparticles, 366–368
  calcium carbonate, 377–378
  ferrite nanoparticles, 376–377
  silica, 368–372
  TiO$_2$ nanoparticles, 372–376
  zinc oxide, 376
processability, 358
and quantum dots (see quantum dots)
semicrystalline polymers, 356

Veenstra model, 497

vinylbenzyldodecyldimethylammonium chloride (VBDAC), 398

viscoelasticity, nanocomposites

dispersion via melt rheology

breakup/rebuilt mechanism, 86
Brønsted equation, 85
clays and graphene sheets, 83
Krieger–Dougherty equation, 85
linear rheology, 84
“morphological” approach, 83
PS-clay nanocomposites, 84
silanized silica nanoparticles, 86

equilibrium shear modulus

EVA/silica composite systems, 80
hydrophilic silica, 79
macroscopic deformation, 78
particle-particle and particle-polymer interactions, 81
power law dependency, 78
scaling concept, fractal dimension, 79
silica-silicone physical gel, 80
thermoplastic nanocomposites, 81

general trends

Brownian motion, 75
colloidal dispersion and traditional composites, 75
filler-matrix interactions, 74
liquid/solid transition, 74
LLDPE, 72

performance enhancement, 72
polymer-particle interactions, 72
Payne effect (see Payne effect)
percolation threshold

carbon black-filled SBR, 76
chemical gelation, 75
lamellar organoclays, 77
laponite particles, 76
nanofiller factors, 77
polybutadiene/clay nanocomposite systems, 78
sol-gel transition, 75
TTS principle, validity of, 81–83
viscoelastic phase separation (VPS), 526–528

Web of Science™, 187, 188
Weissenberg’s rod-climbing effect, 273
wide-angle X-ray diffraction (WAXD), 38, 190
Williams–Landel–Ferry (WLF) equation, 118, 206, 371

X-ray diffraction (XRD), 76, 83

graphene
dispersion, 410
PVDF/GOs nanocomposites, 412–413
PA-6/clay nanocomposites, 46

Young’s modulus, 6, 14, 34, 35, 46, 54, 305, 342, 407, 408, 512

zero shear viscosity

double reptation model, 493
dynamic asymmetry, 493
mLLDPE/LDPE blend, 492
mLLDPE/mHDPE blend, 491–492
positive and negative deviation, 492–493
self-concentration, 493
SMI/SAN blend, 492
